AIR-WATER CHILLERS AND HEAT PUMPS  
FOR OUTDOOR INSTALLATION

CE

INSTALLATION AND OPERATION MANUAL

Dear Customer,

Thank you for having purchased a FERROLI product. It is the result of many years of experiences and of particular research studies and has been made with top quality materials and advanced technologies. The CE mark guarantees that the products satisfy all the applicable European Directives.

The qualitative level is kept under constant control and FERROLI products therefore offer SAFETY, QUALITY and RELIABILITY. Due to the continuous improvements in technologies and materials, the product specification as well as performances are subject to variations without prior notice.

Thank you once again for your preference  
FERROLI S.p.A

The manufacturer declines all responsibility for any inaccuracies in this manual due to printing or typing errors.  
The manufacturer reserves the right to modify the products contents in this catalogue without previous notice.

## GENERAL FEATURES

### General specifications

- This manual and the wiring diagram supplied with the unit must be kept in a dry place and ready to hand for future consultation when required.
- This manual has been compiled to ensure that the unit is installed in the correct way and to supply comprehensive information about how to correctly use and service the appliance. **Before proceeding with the installation phase, please carefully read all the information in this manual, which describes the procedures required to correctly install and use the unit.**
- Strictly comply with the instructions in this manual and conform to the current safety standards.
- The appliance must be installed in accordance with the laws in force in the country in which the unit is installed.
- Unauthorized tampering with the electrical and mechanical equipment will **VOID THE WARRANTY**.
- Check the electrical specifications on the identification plate before making the electrical connections. Read the instructions in the specific section where the electrical connections are described.
- If the unit must be repaired for any reason, this must only be done by a specialized assistance center recognized by the manufacturer and using genuine spare parts.
- The manufacturer also declines all liability for any damage to persons or property deriving from failure of the information in this manual to correspond to the actual unit in your possession.
- **Proper uses: this series of chillers is designed to produce cold or hot water for use in hydronic systems for conditioning/heating purposes. The units are not suitable for the production of domestic hot water.**
- Any use differing from this proper use or beyond the operating limits indicated in this manual is forbidden unless previously agreed with the manufacturer.
- **The prevention of the risk of fire at the installation site is the responsibility of the end user.**

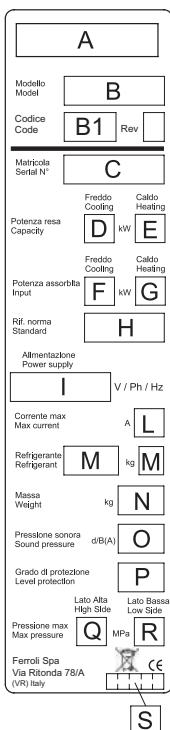

### European Directives

The company hereby declares that the unit in question complies with the matters prescribed by the following Directives:

• Unit Directive	2006/42/CE
• Directive governing pressurized vessels (PED)	97/23/CE
• Electromagnetic compatibility Directive (EMC)	2004/108/CE
• Low voltage Directive (LVD)	2006/95/CE

Any other Directives have to be considered not applicable.

## GENERAL FEATURES

### Presentation of the unit

This series of air-water chillers and heat pumps satisfies the cooling and heating requirements of residential plants of medium size. All the units are suitable for outdoor installation and can be applied to fan coil plants, radiant floor plants and high efficiency radiators plants.

The refrigerant circuit, contained in a compartment protected from the air flow to simplify the maintenance operations, is equipped with scroll compressors mounted on damper supports, brazed plate heat exchanger, thermostatic expansion valve (standard for IR) or electronic expansion valve (standard for IP / option for IR), reverse cycle valve, dehydrator filter, axial fans with safety protection grilles, finned coil made of copper pipes and aluminium louvered fins with subcooling section. The circuit is protected by a safety gas valve, high and low pressure switches and differential pressure switch on the plate heat exchanger. The plate heat exchanger and all the hydraulic pipes are thermally insulated in order to avoid condensate generation and to reduce thermal losses.

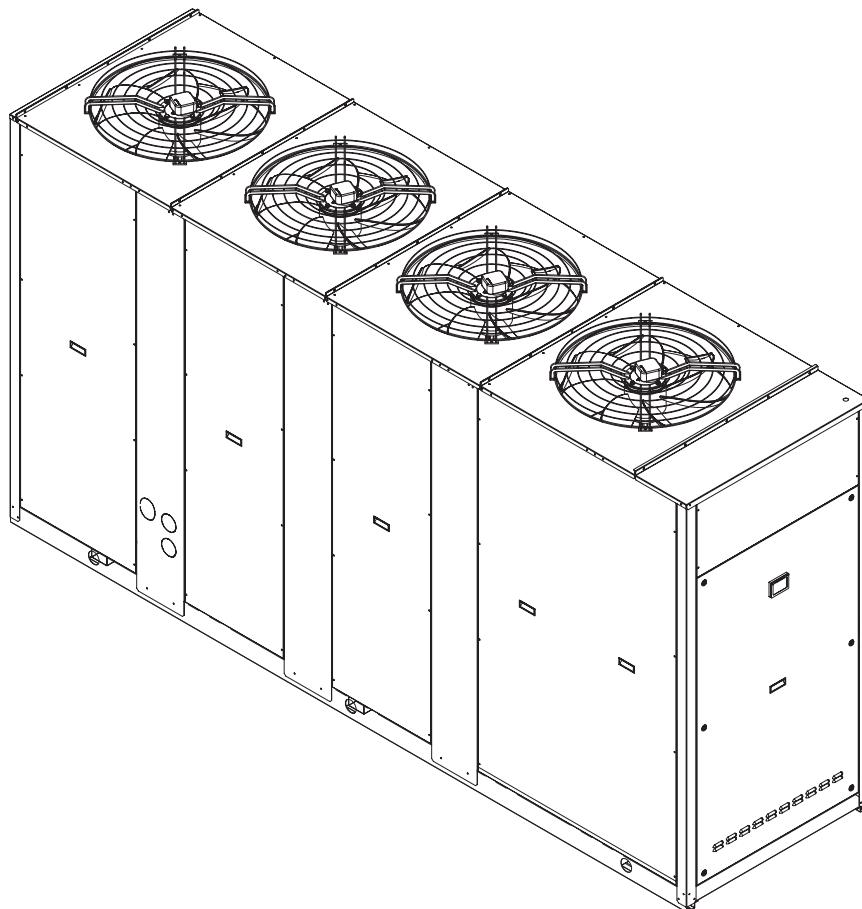

All the units can be equipped with variable speed fans control that allows the units to operate with low outdoor temperatures in cooling and high outdoor temperature in heating and permits to reduce noise emissions in such operating conditions.

The low noise acoustic setting up (AS) is obtained, starting from the base setting up (AB), reducing the rotational speed of the fans and mounting sound jackets on the compressors and the technical compartment is clad with soundproofing material of suitable thickness.

The eXtra low noise acoustic setting up (AX) is obtained, starting from the low noise setting up (AS), further reducing the rotational speed of the fans and using finned coil with bigger surface.

All the units are supplied with a management and control electrical panel containing general switch, phase presence and correct sequence controller, microprocessor controller with display and all the other electrical components with IP54 minimum protection degree.

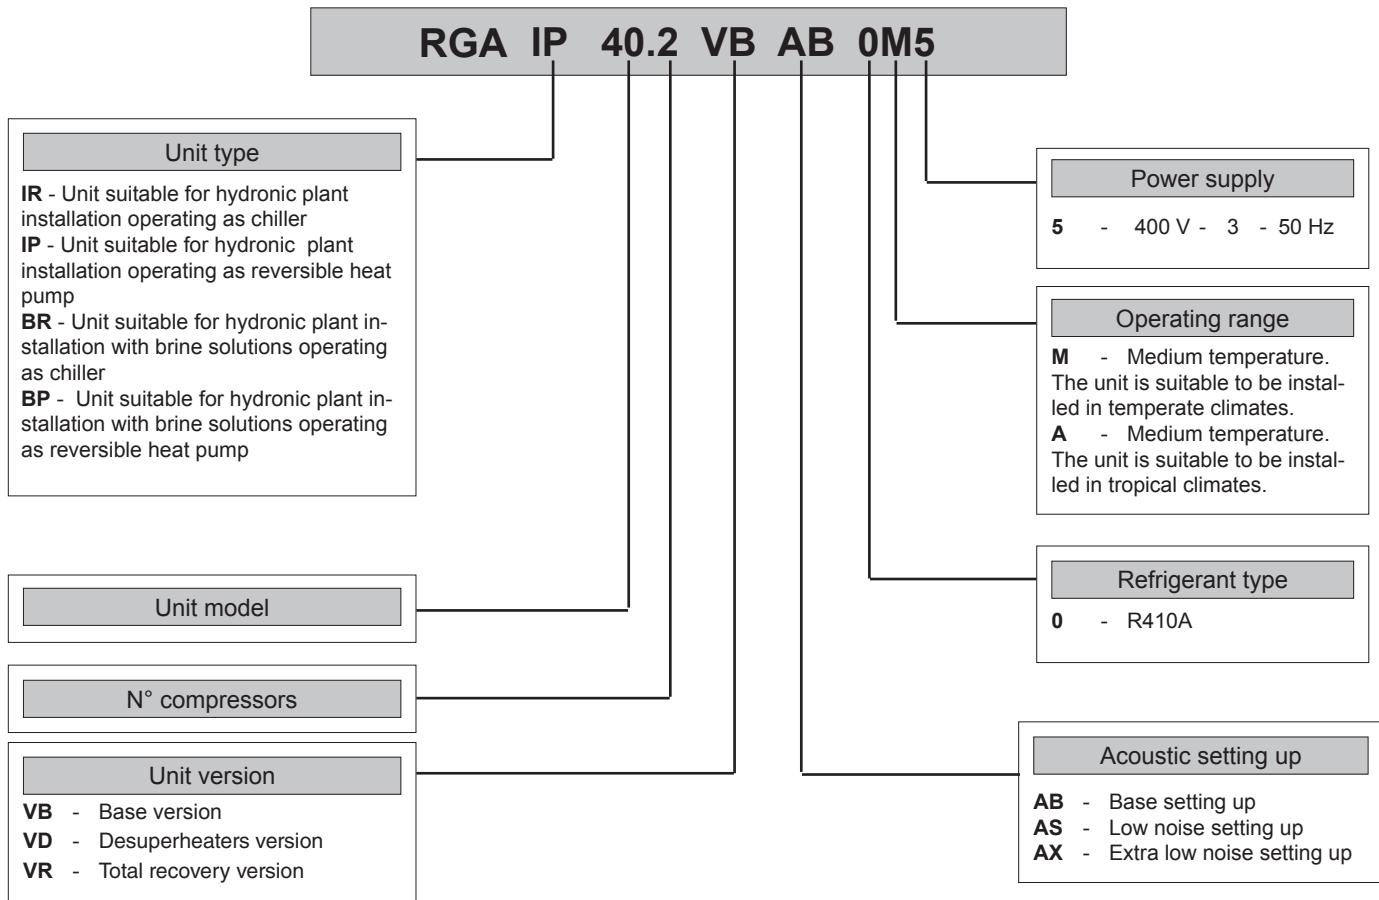

All the units are accurately built and individually tested in the factory. Only electric and hydraulic connections are required for installation.

## GENERAL FEATURES

### Unit identification code

The codes that identify the units and the meaning of the letters used are described below.

The available special versions are described below:

**VB:** Standard unit.

**VD:** Version with Desuperheater (available for both IR units and IP units)

Produces cold water in the same way as the standard version plus hot water from 30 to 70°C at the same time. This is achieved by installing a water-refrigerant gas heat exchanger between the compressor and coils in order to recover 25 to 30% of the heating capacity that would otherwise be dispersed in the air. It helps to remind that hot water production is possible only in combination with cold-hot water production in the main heat exchanger and it is subordinated by it.

**VR:** Total Heat Recovery version

Produces cold water as in the standard version plus hot water at a temperature of 30 to 55°C at the same time. This is achieved thanks to a water-refrigerant gas heat exchanger that totally recovers the heating capacity that would otherwise be dispersed in the air. The total heat recovery function is enabled and disabled by means of a valve on the compressor delivery of each circuit: when the temperature of the water that enters the recuperator drops, the valve switches the hot gas flow from the condensing coils to the recovery heat exchanger. On the other hand, when the temperature of the water reaches the set-point, the valve shuts off the heat recuperator and switches the hot gas flow to the condensing coils. It helps to remind that hot water production is possible only in combination with cold water production in the main heat exchanger and it is subordinated by it.

## GENERAL FEATURES

### Description of the component

**1. Fans.** Axial type, they are contained in a sheet nozzle and are equipped with a safety grille, scythe-shaped blades increase the efficiency and reduce the noise level. The fans are directly coupled to the single-phase motor by means of an external rotor. Thermal protection against operating faults is installed inside the winding. The fans rotational speed can be modulated continuously by an analogue device or an inverter (option) to control the condensation pressure (in cooling) and the evaporation pressure (in heating) in order to extend the operating limits of the unit and to reduce noise emissions. Optionally are available Electronically Commutated (EC) fans, which ensure maximum energy efficiency at reduced speed of rotation.

**2. Electric control and monitoring panel.** It contains all the power, control and security components necessary to guarantee the unit to work properly. The unit is managed by a microprocessor controller to which all the electrical loads and the control devices are connected. The user interface, placed on the frontal panel, allows to view and to modify, if necessary, all the parameters of the unit. This is housed in a metal casing in which the various electrical components are positioned on one metal plate.

**2a.** The power section includes:

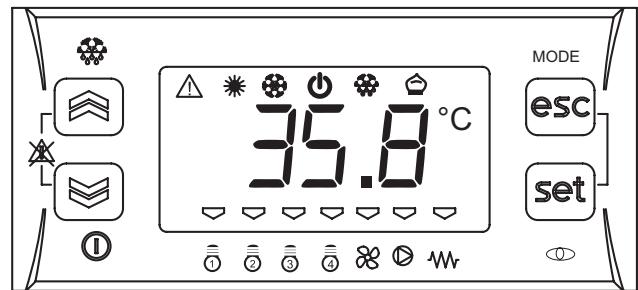

- Main door-locking circuit-breaker.
- Fuse-holder that can be isolated with protection fuse triad for each compressor, or thermal magnetic circuit breakers (option).
- Fuse-holder that can be isolated with protection fuse for compressor oil heaters and antifreeze (if installed), or thermal magnetic circuit breakers (option).
- Control contactor for each compressor or soft starters (option).
- Protection fuse for the fans, or thermal magnetic circuit breakers (option).
- Thermal magnetic contactor switch to protect the pump (if the Hydronic Kit is installed).
- Phase presence and sequence monitoring device on power supply, or voltage monitor and sequence meter (accessory).

**2b.** The auxiliary section includes:

- Fuses on the auxiliary transformer, or thermal magnetic circuit breakers (option).
- Electromagnetic noise filter
- Adjusting fan speed board (option)
- Insulating and safety transformer to power the auxiliary circuit.

**2c.** The microprocessor monitoring section includes:

- User interfacing terminal with display.
- On-off key.
- Operating mode selector key.
- Compressor on-off display LED.
- Operational mode LED
- Antifreeze heaters activated indicator LED.
- Fans on-off display LED
- Pumps on-off display LED
- Check-control with fault code display
- Defrosting, alarm, economy, stand-by LED.

### Control system main functions:

temperature control of the water produced by the unit, compressor and pump operating hour counter, timing and cycling of start-ups, input parameters by keyboard, alarms management, smart defrosting control and operating mode change (only IP unit), dynamic set-point (climatic control), scheduling and integrative heaters control.

If you installed the hydronic kit these functions are enabled: antifreeze with pump, start-up cycle after prolonged inactivity (anti-sticking), if the hydronic kit installed has 2 pumps there is a cycling between each pump to ensure an equivalent lifetime, with inverter modulating hydronic kit the water flow of the plant can be adjusted.

**Digital input functions:** low pressure, high pressure, high temperature on compressor supply, phase presence and sequence monitoring device on power supply, differential water pressure control, compressors thermal protection, fans thermal protection, pumps thermal protection (only if installed MP accessory), ON/OFF and remote operating mode change, demand limit and Economy function, recovery enabling (only for the VR Version), recovery Pump Thermal Protective (only for the VR Version), recovery differential water pressure control (only for the VR Version).

**Digital output functions:** compressor start-up, pump start-up (only with MP accessory), plate heat exchanger electrical heater, remote general alarm, 4-way valve (only IP unit), integrative heaters and clean contact on compressors start-up, recovery valve management (only for the VR Version), recovery pump management (only for the VR Version).

**Analogic input functions:** in and out water temperature, coil temperature probe, external air temperature probe (if present), in and out recovery water temperature (only for the VR Version).

**Analogic output functions:** continuous adjustment of axial fans rotating speed (option for AB and standard for AS and AX acoustic setting up), continuous adjustment of pump rotating speed (only if hydronic kit with modulating pump is installed).

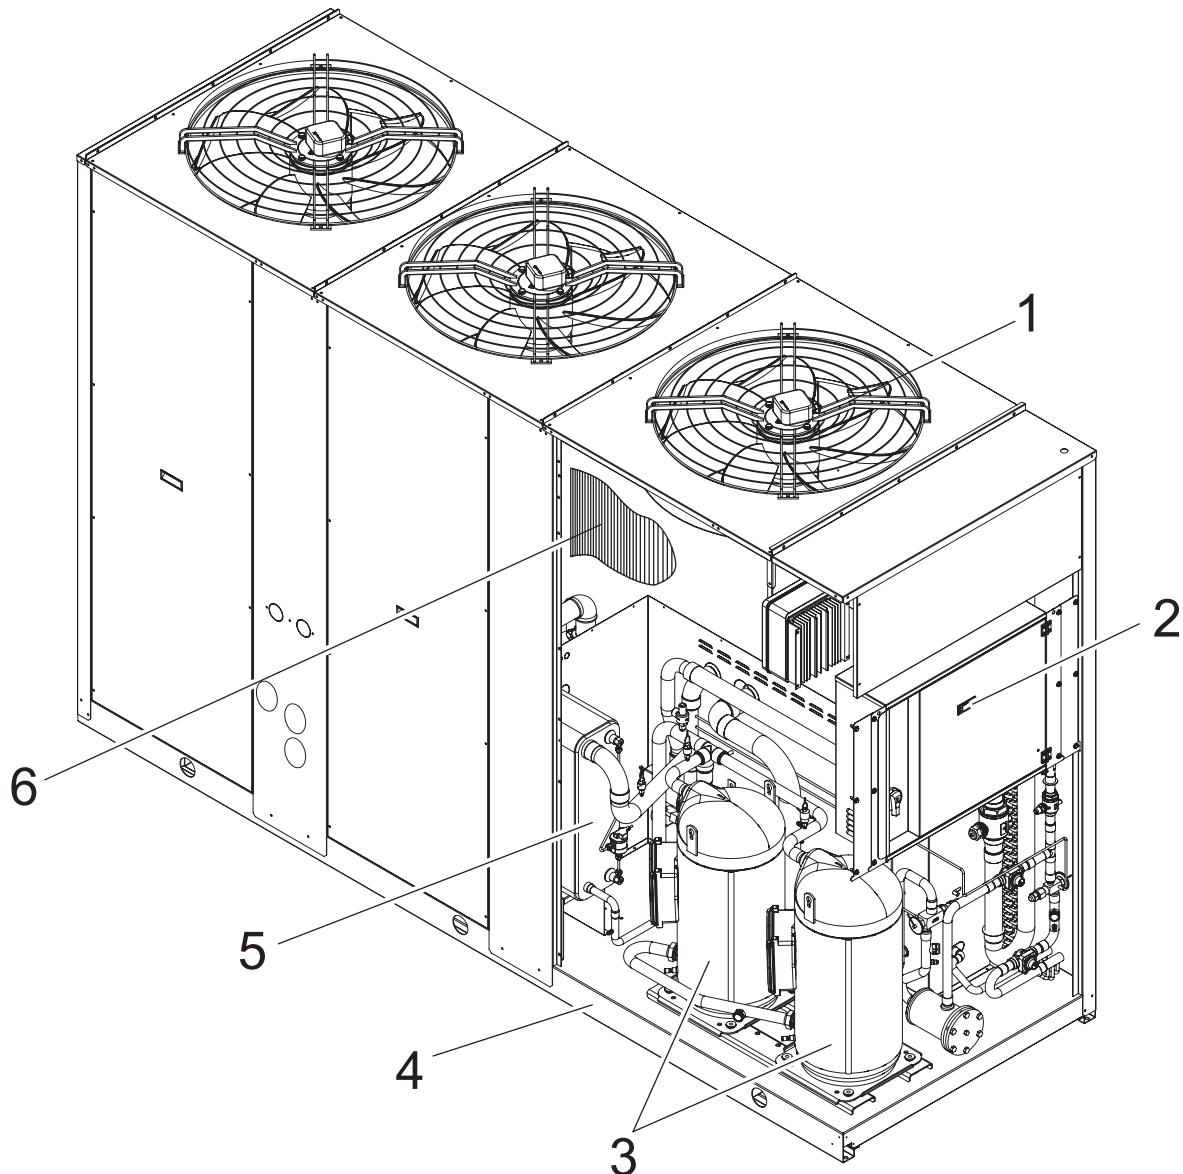

## GENERAL FEATURES

**3. Compressors.** They are the SCROLL type with orbiting coil equipped with built-in thermal protection and oil heater (accessory for IR, as standard for IP). The AS unit includes: a soundproofing jacket for the compressors, to reduce noise level. All units are equipped with two compressors connected in parallel (1 single cooling circuit) which can operate at the same time (100% cooling power) or individually (50% of the cooling power), thus adapting to the different thermal loads of the system supplied.

**4. Frame,** supporting structure and lateral panels are made of galvanized and painted sheet-steel (colour RAL 7035) to guarantee good resistance to the weather. Accessibility to internal parts is possible removing the frontal panel, for other manteinances also the lateral panel can be removed.

**5. Evaporator** made of brazed stainless steel plates (AISI 316). It is installed in a shell of heat-insulating material to prevent the formation of condensation and heat exchanges towards the outside. Standard supply also includes antifreeze heater a differential pressure switch on the water circuit to avoid the risk of freezing if the water flow is shut off for some reason.

**6. Condensing coils**, the aluminium finned pack type with shaped profile to increase the heat exchange coefficient and with copper pipes arranged in staggered rows. A sub-cooling section is integrated into the lower part.

## GENERAL FEATURES

### Hydraulic and cooling circuit components

**7. One-way valves** (IP unit only), allowing the refrigerant gas to pass into the appropriate exchangers, depending on the operating cycle.

**8. 4-way cycle reversal valve** (IP unit only), reverses the flow direction of the refrigerant gas as the summer/winter operating mode is changed.

**9. Safety valve.** Installed on the delivery pipe of the compressors, this operates if extreme faults should occur in the plant.

**10. Fluid valve (accessory).** Ball type, this allows the gas flow on the fluid line to be turned on and off. Along with the cock on the compressor delivery, it allows the components of the fluid line to be subjected to extraordinary maintenance work and the compressors to be replaced if necessary (without discharging the refrigerant gas from the unit).

**11. Compressor delivery valve (accessory).** Ball type, allows the gas delivered to the compressors to be turned on and off.

**12. Dehydrator filter.** Mechanical type. Retains impurities and traces of moisture in the circuit.

Hermetic type for mod. 40÷100 or a cartridge type for mod. 115÷200.

**13. Fluid and humidity indicator.** Signals when fluid passes through the circuit, indicating that the refrigerant gas charge is correct. The fluid indicator light also indicates the amount of moisture in the refrigerant gas by changing colour.

**14. Low pressure** switch (N°1 of series IR version, N°2 of series IP version). With fixed setting. It is installed on the suction pipe and blocks the compressors if the operating pressures drop below the tolerated values. Automatically resets as the pressure increases. If it activates frequently, the unit will block and can only be restarted by resetting via the user interface terminal.

**15. High pressure switch** (n°2). With fixed setting. Are is installed on the delivery pipe and blocks the compressors if the operating pressures exceed the tolerated values. If it activates, the unit will block and can only be restarted by resetting via the user interface terminal.

#### 16. Expansion valve:

- **Thermostatic valve** (standard for IR and BR unit) with external equalizer, this supplies the evaporator correctly, keeping the selected overheating degree at a steady level.

- **Electronic valve** (standard for IP and BP unit, optional for IR and BR unit) supplies the evaporator correctly, keeping the selected overheating degree at a more steady level; ensures a faster response to load changes and superior stability which translates into increased efficiency at partial loads.

**17. Water differential pressure switch.** This is standard supply and is installed on the connections between the water inlet and outlet of the exchanger. It stops the unit if it activates.

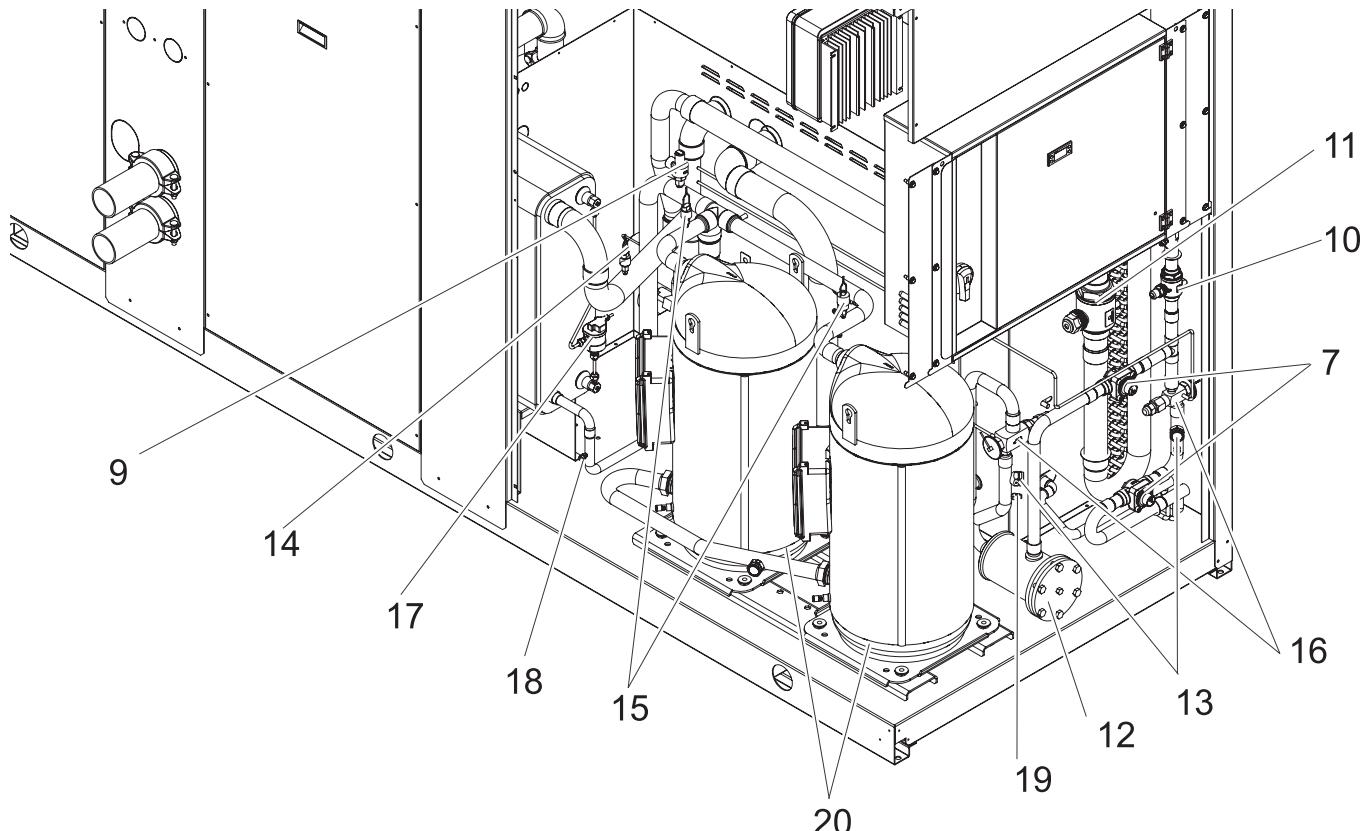

**18. Pressure taps:** 1/4 " SAE (7/16" UNF) type with flow regulator. Allow the operating pressure of the system to be measured: compressor delivery, lamination component inlet, compressor intake.

**19. Pressure taps:** 5/16 " SAE type with flow regulator. Allow the charge/discharge of the gas from the system, precisely from compressor outlet an expansion valve inlet.

**20. Electrical heating elements to heat the compressor oil. "Belt" type (accessory for IR, as standard for IP).** These activate when the compressor turns off and keep the temperature of the oil sufficiently high so as to prevent refrigerant gas from migrating during these pauses.

**Fluid receiver** (IP unit only), this is a plenum tank that accounts for variations to the refrigerant gas charge the unit must supply as the summer/winter operating mode varies.

**Fluid separator** (IP unit only), on the compressor intake to protect against possible fluid back-flows.

## GENERAL FEATURES

### Desuperheater unit VD (available for both IR units and IP units)

#### Hydraulic and chilling circuit components:

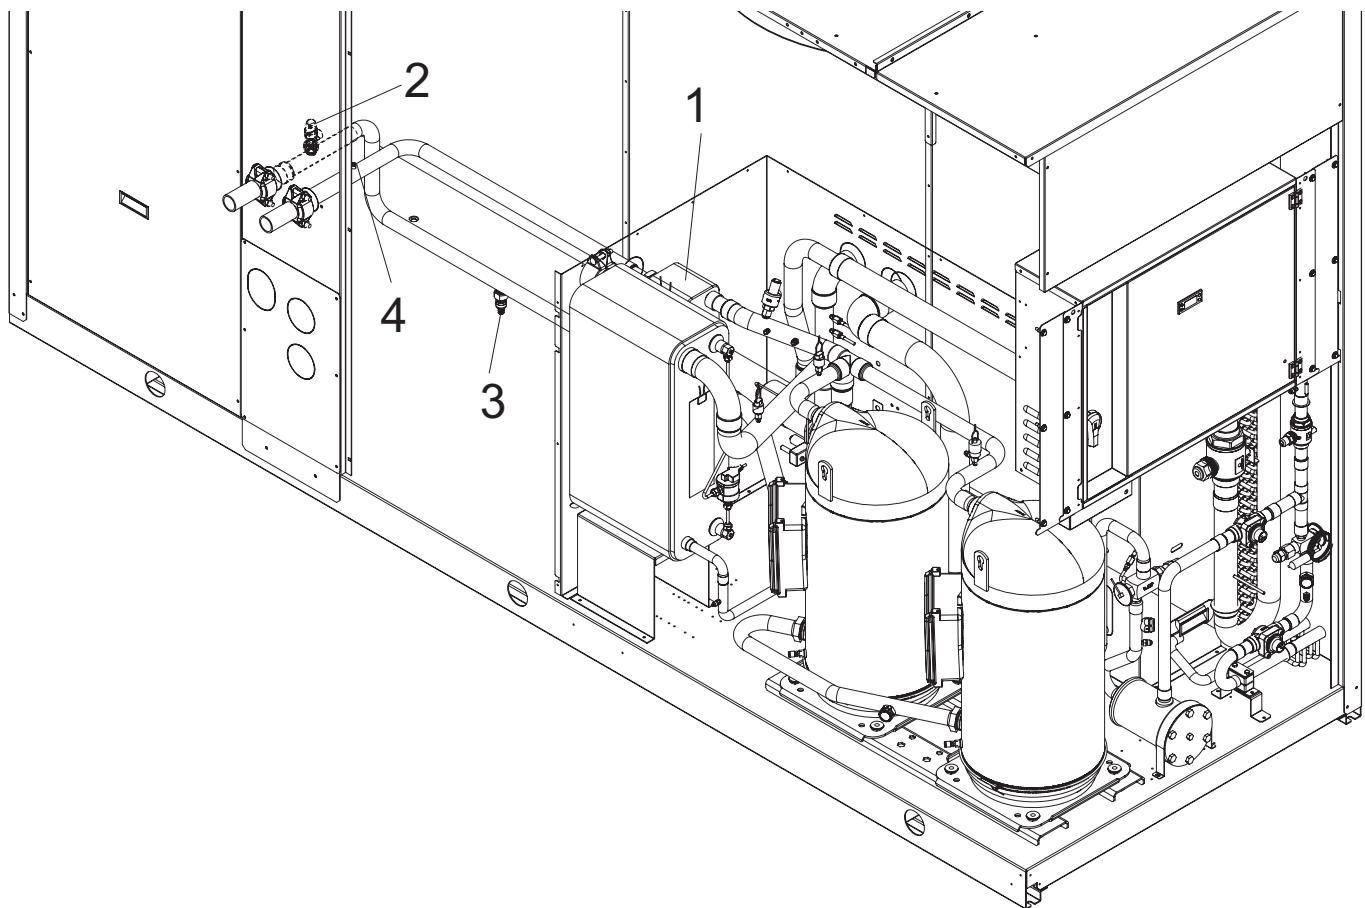

**1. Desuperheater.** Specially designed for the specific version. Plate type, made of stainless steel (AISI 316).

It is installed within a shell of thermal barrier insulating material to prevent heat exchanges towards the outside. Standard supply also includes an electric antifreeze heater to prevent the parts from freezing during the winter, when the system remains at a standstill (if not drained).

**2. Water safety valve.** On the heat recovery inlet pipe. It acts whenever faulty service leads to an operating pressure in the plumbing system that exceeds the valve opening value (Fig.1).

**3. Water drain taps** for emptying the exchangers and pipes of the unit dedicated to heat recovery (Fig. 1).

**4. Air vent.** Accessed by removing the front panels. It consists of a manually operated valve installed in the highest part of the water pipes. To use in conjunction with the water drain cocks situated in the rear part of the unit, for emptying the exchangers and pipes dedicated to heat recovery.

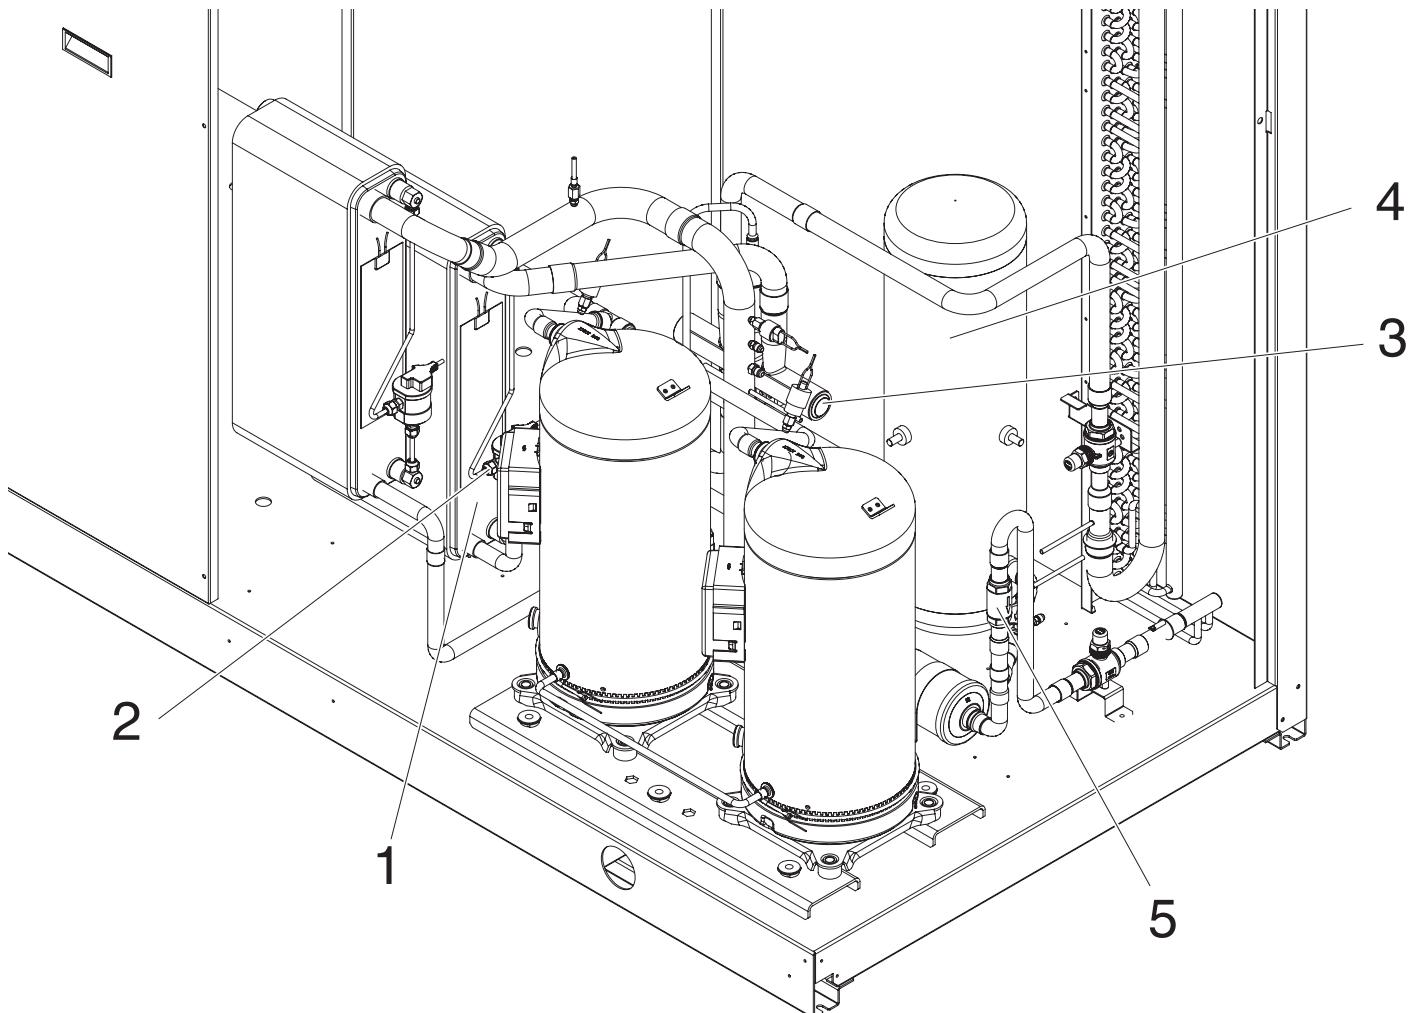

## GENERAL FEATURES

### Total Heat Recovery unit VR (only available for IR units)

#### Hydraulic and cooling circuit components:

1. **Heat recovery exchanger.** Specially designed for the specific version. Plate type, made of stainless steel (AISI 316). It is installed within a shell of thermal barrier insulating material to prevent heat dispersion towards the outside. Standard supply also includes an electric antifreeze heater to prevent the parts from freezing during the winter, if it is not drained.
2. **Differential water pressure switch.** Installed on exchanger. It disables the heat recovery version if activated owing to lack of water flowing through the recovery exchangers.
3. **Heat recovery management valve.** This delivers refrigerant to the condensing coils or heat recovery exchanger, depending on demands for hot water, and into the appropriate exchangers depending on whether hot water is required or not.
4. **Fluid receiver.** This is a plenum tank that accounts for the refrigerant charge variations required by the unit as the operating modes change (condensing in air or in water).
5. **One-way valves.** Make the refrigerant obligatorily pass through the appropriate heat exchangers (coils / heat exchanger), depending on the operating mode.

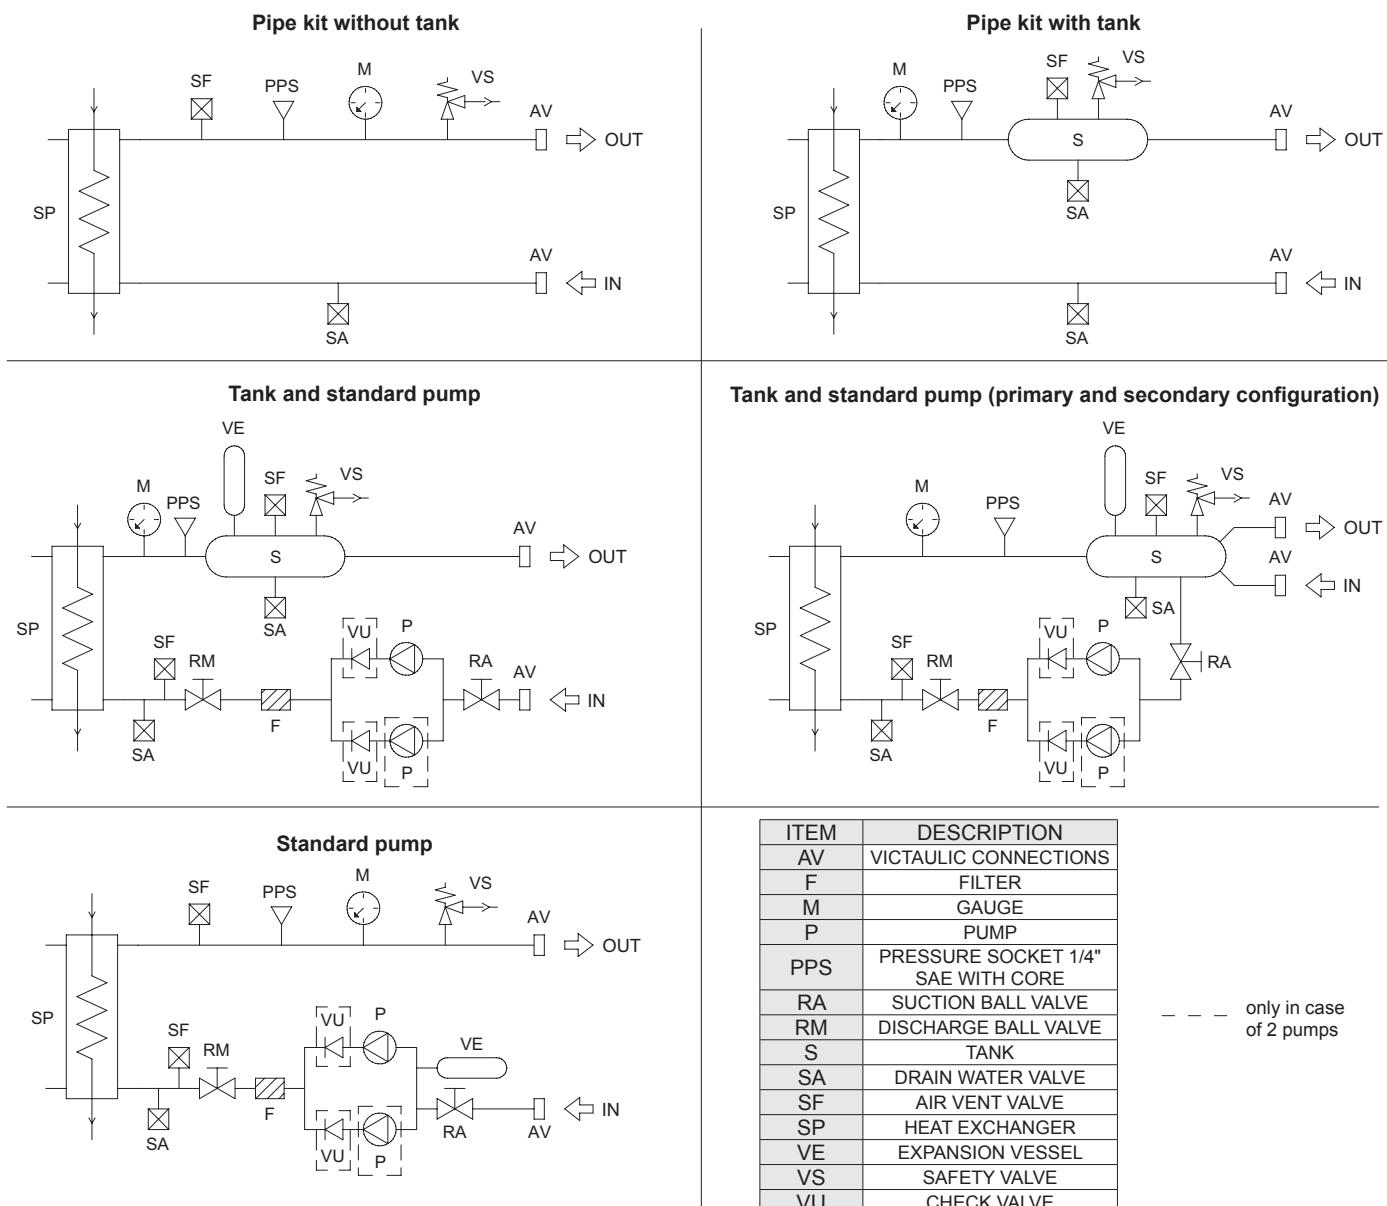

## ACCESSORIES AND OPTIONAL EQUIPMENT

### "Storing and hydronic kit" options

<b>Storing and hydronic kit</b>	<b>MKT SS</b> <b>Pipe kit without tank</b>	This accessory consists of steel pipes insulated with thermal barrier material and allows the water inlet/outlet connection to be routed outside the unit.
	<b>M1P SS 2P STD</b> <b>1 Standard pump</b>	Allows the circulation of the water on the plant side.
	<b>M1P SS 2P HP1</b> <b>1 High head pump</b>	Allows the circulation of the water on the plant side and guarantees a higher available static head, suitable for high pressure drop plants.
	<b>M1PM SS 2P STD</b> <b>1 Standard modulating pump</b>	Allows the circulation of the water on the plant side with the possibility to set the rotational speed of the pump in order to get the requested flow rate without the necessity to install other setting devices.
	<b>M1PM SS 2P HP1</b> <b>1 Standard modulating high head pump</b>	Allows the circulation of the water on the plant side, ensuring a higher available static head, suitable for high pressure drop plants, with the possibility to set the rotational speed of the pump in order to get the requested flow rate without the necessity to install other setting devices.
	<b>M2P SS 2P STD</b> <b>2 Standard pumps</b>	Allows the circulation of the water on the plant side and includes a second pump installed as a backup to the first.
	<b>M2P SS 2P HP1</b> <b>2 High head pumps</b>	Allows the circulation of the water on the plant side, ensuring a higher available static head, suitable for high pressure drop plants, and includes a second pump installed as a backup to the first.
	<b>MKT AM</b> <b>Pipe kit with tank</b>	This accessory consists of steel pipes insulated with thermal barrier material and allows the water inlet/outlet connection to be routed outside the unit. The thermal inertia of the buffer tank allows to reduce the number of compressor starts and to guarantee a more stable flow temperature.
	<b>M1P AM 2P STD</b> <b>Tank and 1 standard pump</b>	Allows the circulation of the water on the plant side. The thermal inertia of the buffer tank allows to reduce the number of compressor starts and to guarantee a more stable flow temperature.
	<b>M1P AM 2P HP1</b> <b>Tank and 1 high head pump</b>	Allows the circulation of the water on the plant side and guarantees a higher available static head, suitable for high pressure drop plants. The thermal inertia of the buffer tank allows to reduce the number of compressor starts and to guarantee a more stable flow temperature.
	<b>M1PM AM 2P STD</b> <b>Tank and 1 modulating standard pump</b>	Allows the circulation of the water on the plant side with the possibility to set the rotational speed of the pump in order to get the requested flow rate without the necessity to install other setting devices. The thermal inertia of the buffer tank allows to reduce the number of compressor starts and to guarantee a more stable flow temperature.
	<b>M1PM AM 2P HP1</b> <b>Tank and 1 modulating high head pump</b>	Allows the circulation of the water on the plant side, ensuring a higher available static head, suitable for high pressure drop plants, with the possibility to set the rotational speed of the pump in order to get the requested flow rate without the necessity to install other setting devices. The thermal inertia of the buffer tank allows to reduce the number of compressor starts and to guarantee a more stable flow temperature.
	<b>M2P AM 2P STD</b> <b>Tank and 2 standard pumps</b>	Allows the circulation of the water on the plant side and includes a second pump installed as a backup to the first. The thermal inertia of the buffer tank allows to reduce the number of compressor starts and to guarantee a more stable flow temperature.
	<b>M2P AM 2P HP1</b> <b>Tank and 2 high head pumps</b>	Allows the circulation of the water on the plant side, ensuring a higher available static head, suitable for high pressure drop plants, and includes a second pump installed as a backup to the first. The thermal inertia of the buffer tank allows to reduce the number of compressor starts and to guarantee a more stable flow temperature.
	<b>M1P PS 2P STD</b> <b>Tank and 1 standard pump (primary and secondary configuration)</b>	Allows the circulation of the water on the primary between the tank and the heat exchanger. The thermal inertia of the buffer tank allows to reduce the number of compressor starts and to guarantee a more stable flow temperature.
	<b>M2P PS 2P STD</b> <b>Tank and 2 standard pumps (primary and secondary configuration)</b>	Allows the circulation of the water on the primary between the tank and the heat exchanger and includes a second pump installed as a backup to the first. The thermal inertia of the buffer tank allows to reduce the number of compressor starts and to guarantee a more stable flow temperature.

## ACCESSORIES AND OPTIONAL EQUIPMENT

### Options

<b>Expansion valve</b>	<b>Thermostatic</b>	(standard for IR and BR unit) with external equalizer, this supplies the evaporator correctly, keeping the selected overheating degree at a steady level.
	<b>Electronic</b>	(standard for IP and BP unit, optional for IR and BR unit) supplies the evaporator correctly, keeping the selected overheating degree at a more steady level; ensures a faster response to load changes and superior stability which translates into increased efficiency at partial loads.
<b>Soft starter</b>		Reduces the compressor start current of about 40%.
<b>Compressor power factor correction</b>		Allows to reduce the phase shift between the absorbed current and the power supply voltage keeping it above the value of 0,91.
<b>Fans control</b>	<b>On-off</b>	(standard for AB unit) the condensation pressure (in cooling) and the evaporation pressure (in heating) is regulated by on-off cycles.
	<b>Modulating control (condensation / evaporation control)</b>	(standard for AS and AX unit, optional for AB unit) The fans rotational speed can be modulated continuously by an adjusting fan speed device to control the condensation pressure (in cooling) and the evaporation pressure (in heating) in order to extend the operating limits of the unit, to reduce noise emissions and improve energy efficiency.
	<b>Modulating control (condensation / evaporation control) with EC fans</b>	(optional for AB, AS and AX unit) The fans rotational speed can be modulated continuously by EC fans (Electronic Commutation) to control the condensation pressure (in cooling) and the evaporation pressure (in heating) in order to extend the operating limits of the unit, to reduce noise emissions and maximize energy efficiency.
<b>Electrical protection load</b>	<b>Fuses</b>	Allows to protect the electrical loads with fuses.
	<b>Thermal magnetic</b>	Allows to protect the electrical loads with thermal magnetic circuit breakers simplifying the maintenance and reload operations.

## ACCESSORIES AND OPTIONAL EQUIPMENT

### Accessories

#### Supplied accessories

<b>Rubber vibration dampers</b>	Allow to reduce the transmission to the unit support plane of the mechanical vibrations generated by the compressor and by the fans in their normal operating mode, the degree of isolation is about 85%
<b>Spring vibration dampers</b>	Allow to reduce the transmission to the unit support plane of the mechanical vibrations generated by the compressor and by the fans in their normal operating mode, the degree of isolation is about 90%
<b>Water paddle flow switch</b>	Allows to detect the water flow lack through the plate heat exchanger and operates as an integration of the protection offered by the differential pressure switch (standard).
<b>Tank antifreeze electrical heater</b>	Activated together with the antifreeze electrical heater of the plate heat exchanger, it has the task to keep the still water in the buffer tank at a temperature high enough to avoid ice generation during winter.
<b>Remote control</b>	It is suitable for wall mounting and reports all the control and visualization functions available on the user interface placed on the unit. It therefore allows the complete remote control of the unit.
<b>Programmer clock</b>	It allows the unit to be turned on and off according to a set program, through the digital input available on the unit wiring board (remote stand by).
<b>Modbus serial interface on RS485</b>	It allows to communicate with the unit controller and to view the operating conditions of the unit through Modbus communication protocol. The RS485 serial line ensures the signal quality up to distances of about 1200 meters (that can be extended by means of proper repeaters).
<b>Phase sequence and voltage controller</b>	It checks not only the presence and correct order of the power supply phases but also the voltage level on each phase and avoid the unit to operate with voltage levels outside the permitted limits.

#### Factory mounted accessories

<b>Victaulic connections</b>	This accessory consists of steel pipes that allows the water inlet/outlet to be connected straight inside the unit.
<b>Coil protection grilles</b>	Protects the external surface of the finned coil.
<b>High and low pressure gauges</b>	2 pressure gauges allow visualization of high and low refrigerant gas pressure.
<b>Coil shut off valves</b>	It consists of two ball valves installed before and after the coil that allow for the pump-down maintenance.
<b>Outdoor air sensor</b>	External air probe mounted near coil allows smart defrosting, climatic variation of setpoint and enables heat pump stop reducing the external air temperature below a setpoint.
<b>High temperature thermostat</b>	Two thermostats in series on compressors outlet pipes preserve operation not allowing temperature to rise up than a specified non adjustable value.
<b>Low temperature kit</b>	(di serie per unità IP e BP, optional per unità IR e BR) sono costituite da resistenze carter di riscaldamento olio compressori.
<b>Tank antifreeze electrical heater</b>	Activated together with the antifreeze electrical heater of the plate heat exchanger, it has the task to keep the still water in the buffer tank at a temperature high enough to avoid ice generation during winter.
<b>Modbus serial interface on RS485</b>	It allows to communicate with the unit controller and to view the operating conditions of the unit through Modbus communication protocol. The RS485 serial line ensures the signal quality up to distances of about 1200 meters (that can be extended by means of proper repeaters).
<b>Phase sequence and voltage controller</b>	It checks not only the presence and correct order of the power supply phases but also the voltage level on each phase and avoid the unit to operate with voltage levels outside the permitted limits.
<b>ATC Advanced temperature control</b>	It consists of a properly calibrated pressure switch that partializes the unit preventing the high pressure alarm.
<b>Pressure transducer</b>	It consists of a transducer, which allows operation of the control condensation, evaporation and defrost by reading the pressure.

#### Mechanical options

For finned coils with special treatment (copper fins, tin-copper plated, acrylic, epoxy or hydrophilic painting) please contact our technical department.

#### Electrical options

For other voltages, please contact our technical department

Tw= Outlet water temperature °C

kWf = Cooling capacity (kW)

kWa = Compressor power input (kW)

kWt = Heating capacity (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at nominal or maximum speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level ( $P_b = 1013\text{mbar}$ ).

**The performances are declared no considering any correction due to water flow rate and water side pressure drop (gross performance).**

(1) : at these temperatures the fans are at maximum speed.

(2) : ATC (Advanced Temperature Control) function may occur, if present.

Tw= Outlet water temperature °C

kWf = Cooling capacity (kW)

kWa = Compressor power input (kW)

kWt = Heating capacity (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at nominal or maximum speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level ( $P_b = 1013\text{mbar}$ ).

**The performances are declared no considering any correction due to water flow rate and water side pressure drop (gross performance).**

(1) : at these temperatures the fans are at maximum speed.

(2) : ATC (Advanced Temperature Control) function may occur, if present.

Tw= Outlet water temperature °C

kWf = Cooling capacity (kW)

kWa = Compressor power input (kW)

kWt = Heating capacity (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at nominal or maximum speed. A 0.44 x 10<sup>-4</sup> m<sup>2</sup> K/W fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

**The performances are declared no considering any correction due to water flow rate and water side pressure drop (gross performance).**

(1) : at these temperatures the fans are at maximum speed.

(2) : ATC (Advanced Temperature Control) function may occur, if present.

Tw= Outlet water temperature °C

kWf = Cooling capacity (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at nominal or maximum speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level ( $P_b = 1013\text{mbar}$ ).

***The performances are declared no considering any correction due to water flow rate and water side pressure drop (gross performance).***

(1) : at these temperatures the fans are at maximum speed.

(2) : ATC (Advanced Temperature Control) function may occur, if present.

Tw= Outlet water temperature °C

kWf = Cooling capacity (kW)

kWa = Compressor power input (kW)

kWt = Heating capacity (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at nominal or maximum speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level ( $P_b = 1013\text{mbar}$ ).

**The performances are declared no considering any correction due to water flow rate and water side pressure drop (gross performance).**

(1) : at these temperatures the fans are at maximum speed.

(2) : ATC (Advanced Temperature Control) function may occur, if present.

Tw= Outlet water temperature °C

kWf = Cooling capacity (kW)

kWa = Compressor power input (kW)

kWt = Heating capacity (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at nominal or maximum speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level ( $P_b = 1013 \text{ mbar}$ ).

**The performances are declared no considering any correction due to water flow rate and water side pressure drop (gross performance).**

(1) : at these temperatures the fans are at maximum speed.

(2) : ATC (Advanced Temperature Control) function may occur, if present.

**Tw=** Outlet water temperature °C

**kWf =** Cooling capacity (kW)

**kWa =** Compressor power input (kW)

**kWt =** Heating capacity (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at nominal or maximum speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level ( $P_b = 1013\text{mbar}$ ).

**The performances are declared no considering any correction due to water flow rate and water side pressure drop (gross performance).**

(1) : at these temperatures the fans are at maximum speed.

(2) : ATC (Advanced Temperature Control) function may occur, if present.

Tw= Outlet water temperature °C

kWf = Cooling capacity (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at nominal or maximum speed. A 0.44 x 10<sup>-4</sup> m<sup>2</sup> K/W fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

**The performances are declared no considering any correction due to water flow rate and water side pressure drop (gross performance).**

(1) : at these temperatures the fans are at maximum speed.

kWa = Compressor power input (kW)

kWt = Heating capacity (kW)

Tw= Outlet water temperature °C

kWf = Cooling capacity (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at nominal or maximum speed. A 0.44 x 10<sup>-4</sup> m<sup>2</sup> K/W fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

**The performances are declared no considering any correction due to water flow rate and water side pressure drop (gross performance).**

(1) : at these temperatures the fans are at maximum speed.

## TECHNICAL DATA - BASE VERSION (VB)

### Correction factor for the use of glycol in heating mode

**ETHYLENE GLYCOL** with water produced between 30 ÷ 55 ° C.

Percentage Of glycol in mass / volume	0 / 0	10 / 8,9	20 / 18,1	30 / 27,7	40 / 37,5
Freezing point [°C]	0	-3,2	-8	-14	-22
CCPT - Heating capacity	1,000	0,995	0,985	0,975	0,970
CCPA - Power input	1,000	1,010	1,015	1,020	1,030
CCQA - Water flow rate	1,000	1,038	1,062	1,091	1,127
CCDP - Water pressure drop	1,000	1,026	1,051	1,077	1,103

**PROPYLENE GLYCOL** with water produced between 30 ÷ 55°C.

Percentage Of glycol in mass / volume	0 / 0	10 / 9,6	20 / 19,4	30 / 29,4	40 / 39,6
Freezing point [°C]	0	-3,3	-7	-13	-21
CCPT - Heating capacity	1,000	0,990	0,975	0,965	0,955
CCPA - Power input	1,000	1,010	1,020	1,030	1,040
CCQA - Water flow rate	1,000	1,018	1,032	1,053	1,082
CCDP - Water pressure drop	1,000	1,026	1,051	1,077	1,103

Based on DESIGN CONDITIONS from the table "performances" extract Heating Capacity (kWt<sub>r</sub>).

Based on type and percentage of glycol extract CCPT, CCQA, CCDP.

Then calculate.

$$Pt_{brine} = kWt_r \times CCPT$$

$$Pass_{CP\_brine} = kWa \times CCPA$$

Then calculate brine flow rate to the heat recovery exchanger:

$$Q_{brine} [l/s] = CCQA \times (Pt_{brine} [kW] * 0.86 / \Delta T_{brine}) / 3.6$$

where  $\Delta T_{brine}$  is the temperature difference outlet-inlet heat recovery exchanger:

$$\Delta T_{brine} = Twout_{brine} - Twin_{brine}$$

With this brine flow rate enter in abscissa on the water pressure drop of the heat recovery then you have Dp\_app.

Finally you can calculate the actual pressure drop of the brine on heat recovery:

$$Dp_{brine} = CCDP \times Dp_{app}$$

## TECHNICAL DATA - BASE VERSION (VB)

### Correction factor for the use of glycol in cooling mode

**ETHYLENE GLYCOL** with water produced between 5 ÷ 20 ° C.

Percentage Of glycol in mass / volume	0 / 0	10 / 8,9	20 / 18,1	30 / 27,7	40 / 37,5
Freezing point [°C]	0	-3,2	-8	-14	-22
CCPF - Cooling capacity	1,00	0,99	0,98	0,97	0,95
CCPA - Power input	1,00	1,00	0,99	0,99	0,98
CCQA - Water flow rate	1,00	1,04	1,08	1,12	1,16
CCDP - Water pressure drop	1,00	1,08	1,16	1,25	1,35

**PROPYLENE GLYCOL** with water produced between 5 ÷ 20 ° C.

Percentage Of glycol in mass / volume	0 / 0	10 / 9,6	20 / 19,4	30 / 29,4	40 / 39,6
Freezing point [°C]	0	-3,3	-7	-13	-21
CCPF - Cooling capacity	1,00	0,98	0,96	0,94	0,92
CCPA - Power input	1,00	0,99	0,98	0,95	0,93
CCQA - Water flow rate	1,00	1,01	1,03	1,06	1,09
CCDP - Water pressure drop	1,00	1,05	1,11	1,22	1,38

Based on outdoor air temperature and leaving water temperature of the evaporator (DESIGN CONDITIONS) from the table "performances" extract Cooling Capacity (kWf) and Compressors Power Input (kWa).

Based on type and percentage of glycol extract CCPF, CCPA, CCQA, CCDP.

Then calculate.

$$Pf_{brine} = kWf \times CCPF$$

$$Pass\_CP\_brine = kWa \times CCPA$$

Then calculate brine flow rate of the evaporator:

$$Q_{brine\_evap} [l/s] = CCQA \times (Pf_{brine} [kW] * 0.86 / \Delta T_{brine}) / 3.6$$

where  $\Delta T_{brine}$  is the difference inlet-outlet evaporator water temperature:

$$\Delta T_{brine} = T_{inlet\_evap\_brine} - T_{outlet\_evap\_brine}$$

With this brine flow rate enter in abscissa on the water pressure drop of the evaporator then you have Dp\_app.

Finally you can calculate the actual pressure drop of the brine on evaporator side:

$$Dp_{evap\_brine} = CCDP \times Dp_{app}$$

### Fouling factors

The performances supplied with the tables are referred to a fouling factory =  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$ . For different values of the fouling factory, use the reduction coefficients reported in the following table.

Fouling factory	Evaporator	
	F.c. PF	F.c. PA
( $\text{m}^2 \text{ K / W}$ )	<b><math>0,44 \times 10^{-4}</math></b>	<b>1,00</b>
( $\text{m}^2 \text{ K / W}$ )	$0,86 \times 10^{-4}$	0,98
( $\text{m}^2 \text{ K / W}$ )	$1,72 \times 10^{-4}$	0,93

**F.c. PF:** Correction Factor for Cooling capacity

**F.c. PA:** Correction Factor for compressor power Input

## TECHNICAL DATA - BR - BP UNIT

### Mandatory requirements for BR and BP units

BR and BP units must be used with a mixture of water and antifreeze fluid (eg glycol) in a percentage enough to prevent freezing of the mixture under all possible conditions, otherwise it will **VOID THE WARRANTY**.

Please contact our customer service to set the following parameters: →

Correction factors to apply to the basic version data.

Parameter to set	Default value	How to calculate the value to set	Example with TWE = 0°C	Example with TWE = -5°C
R <sub>L5</sub> I	3 °C	TWE -4 °C	-4 °C	-9 °C
E <sub>r</sub> 10	9 °C	TWE +2 °C	+2 °C	-3 °C
E <sub>r</sub> 11	7 °C	TWE +2 °C	+2 °C	-3 °C
H <sub>I</sub> 12	4 °C	TWE -3 °C	-3 °C	-8 °C
H <sub>I</sub> 14	4 °C	TWE -3 °C	-3 °C	-8 °C

TWE= Evaporator outlet desired water temperature

CCDP - Pressure drop	1,160	1,175	1,190	1,200	1,210	1,255	1,300	-	-	

Percentage Of glycol in mass / volume	40 / 39,6									
Freezing point [°C]	-21									
Produced water temperature	4	2	0	-2	-4	-6	-8	-10	-12	
CCPF - Cooling capacity	0,848	0,784	0,719	0,670	0,620	0,570	0,520	0,478	0,438	
CCPA - Power input	0,865	0,855	0,845	0,820	0,795	0,773	0,750	0,714	0,680	
CCQA - Water flow rate	1,116	1,114	1,112	1,110	1,108	1,107	1,105	1,103	1,101	
CCDP - Pressure drop	1,230	1,275	1,320	1,375	1,430	1,500	1,570	1,642	1,724	

Based on leaving water temperature of the evaporator and condensing temperature = 7°C from the table "performances" extract Cooling Capacity (kWf) and Compressors Power Input (kWa).

Based on type and percentage of glycol extract CCPF, CCPA, CCQA, CCDP.

Then calculate:

$$Pf_{brine} = kWf \times CCPF$$

$$Pass\_CP_{brine} = kWa \times CCPA$$

Then calculate brine flow rate:

$$Q_{brine\_evap} [l/s] = CCQA \times (Pf_{brine} [kW] * 0.86 / \Delta T_{brine}) / 3.6$$

where  $\Delta T_{brine}$  is the difference between inlet-outlet evaporator water temperature:

$$\Delta T_{brine} = Twin_{evap\_brine} - Twout_{evap\_brine}$$

With this brine flow rate enter in abscissa on the water pressure drop of the evaporator then you have Dp\_app.

Finally you can calculate the actual pressure drop of the brine on evaporator side:

$$Dp_{evap\_brine} = CCDP \times Dp_{app}$$

kWtr = Recovery heat capacity

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at nominal or maximum speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level ( $P_b = 1013 \text{ mbar}$ ).

**The performances are declared no considering any correction due to water flow rate and water side pressure drop (gross performance).**

kWtr = Recovery heat capacity

TWR = Desuperheater outlet waterl temperature, Δtin-out= 5°C

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at nominal or maximum speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

**The performances are declared no considering any correction due to water flow rate and water side pressure drop (gross performance).**

kWtr = Recovery heat capacity

TWE= Evaporator outlet water temperature °C

TWR = Desuperheater outlet waterl temperature, Δtin-out= 5°C

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at nominal or maximum speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level ( $P_b = 1013\text{mbar}$ ).

***The performances are declared no considering any correction due to water flow rate and water side pressure drop (gross performance).***

## NOISE LEVELS

The noise levels refer to units operating in the nominal conditions (A35W7), due to a change of external air temperature noise levels may change to ensure proper functioning of the unit within operating range.

The acoustic pressure levels are calculated 1 / 5 / 10 meters away from the outer surface of the unit operating in the free field and resting on a reflecting surface (directional factor of 2).

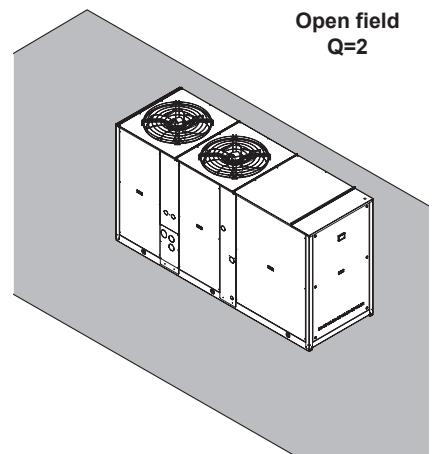

**SWL = Sound power levels, with reference to  $1 \times 10^{-12}$  W.**

The Total sound power level in dB(A) measured in compliance with ISO 9614 standards, is certified according to the Eurovent certification program.

Eurovent certification (E) exclusively refers to the Total Sound Power in dB(A), which is therefore the only binding acoustic specification (the values of the Octave bands in the table are indicative).

**SPL = Sound pressure levels, with reference to  $2 \times 10^{-5}$  Pa.**

The sound pressure levels are values calculated by applying the ISO-3744 relation (Eurovent 8/1).

(E): Data declared according to EUROVENT LCP certification programme. The values are for units without options and accessories.

## OPERATING RANGE

### Operating range

The table below lists the operating ranges within which correct operation of the units is guaranteed, depending on the Version and Operating Mode available for each type of unit.

Remember that in Heat Pump units, heat recovery only takes place during operation in the cooling mode.

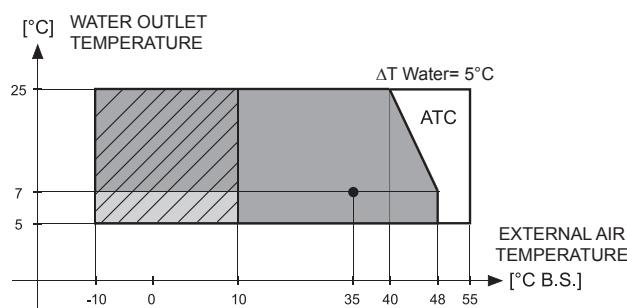

**NOTE:** the admissible limits for water flow rate on heat exchangers are indicated under the related pressure drop graph (see section "water pressure drop"). If the unit is equipped with pumping module the admissible limits are indicated under the related working head graph (see section "working head").

### Operating range of Base version

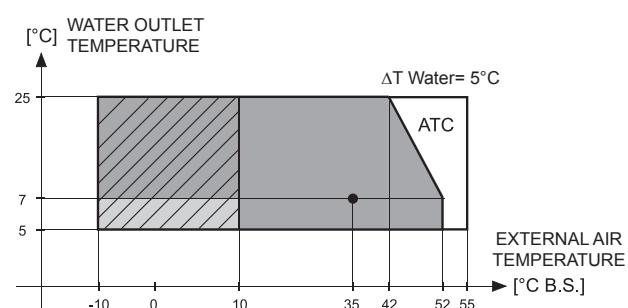

Thermal gradient of the water		Limit value
Minimum	°C	3
Maximum	°C	8
Verify that water flow rate is inside the admissible limits.		

### IN COOLING MODE

**UNIT MEDIUM TEMPERATURE - 0 M 5**

**UNIT HIGH TEMPERATURE - 0 A 5**

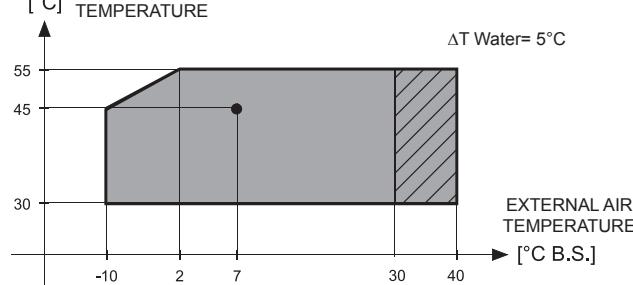

With accessory fans modulating control

With accessory fans modulating control (brine is recommended)

ATC (Advanced Temperature Control) function may occur, if present

### IN HEATING MODE

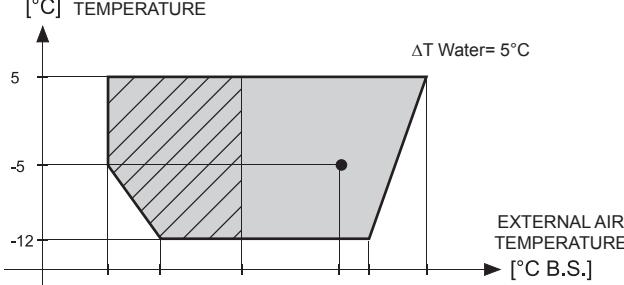

**UNIT MEDIUM TEMPERATURE - 0 M 5**

With accessory fans modulating control

### BRINE UNIT BR - BP - IN COOLING MODE

**UNIT HIGH TEMPERATURE - 0 A 5**

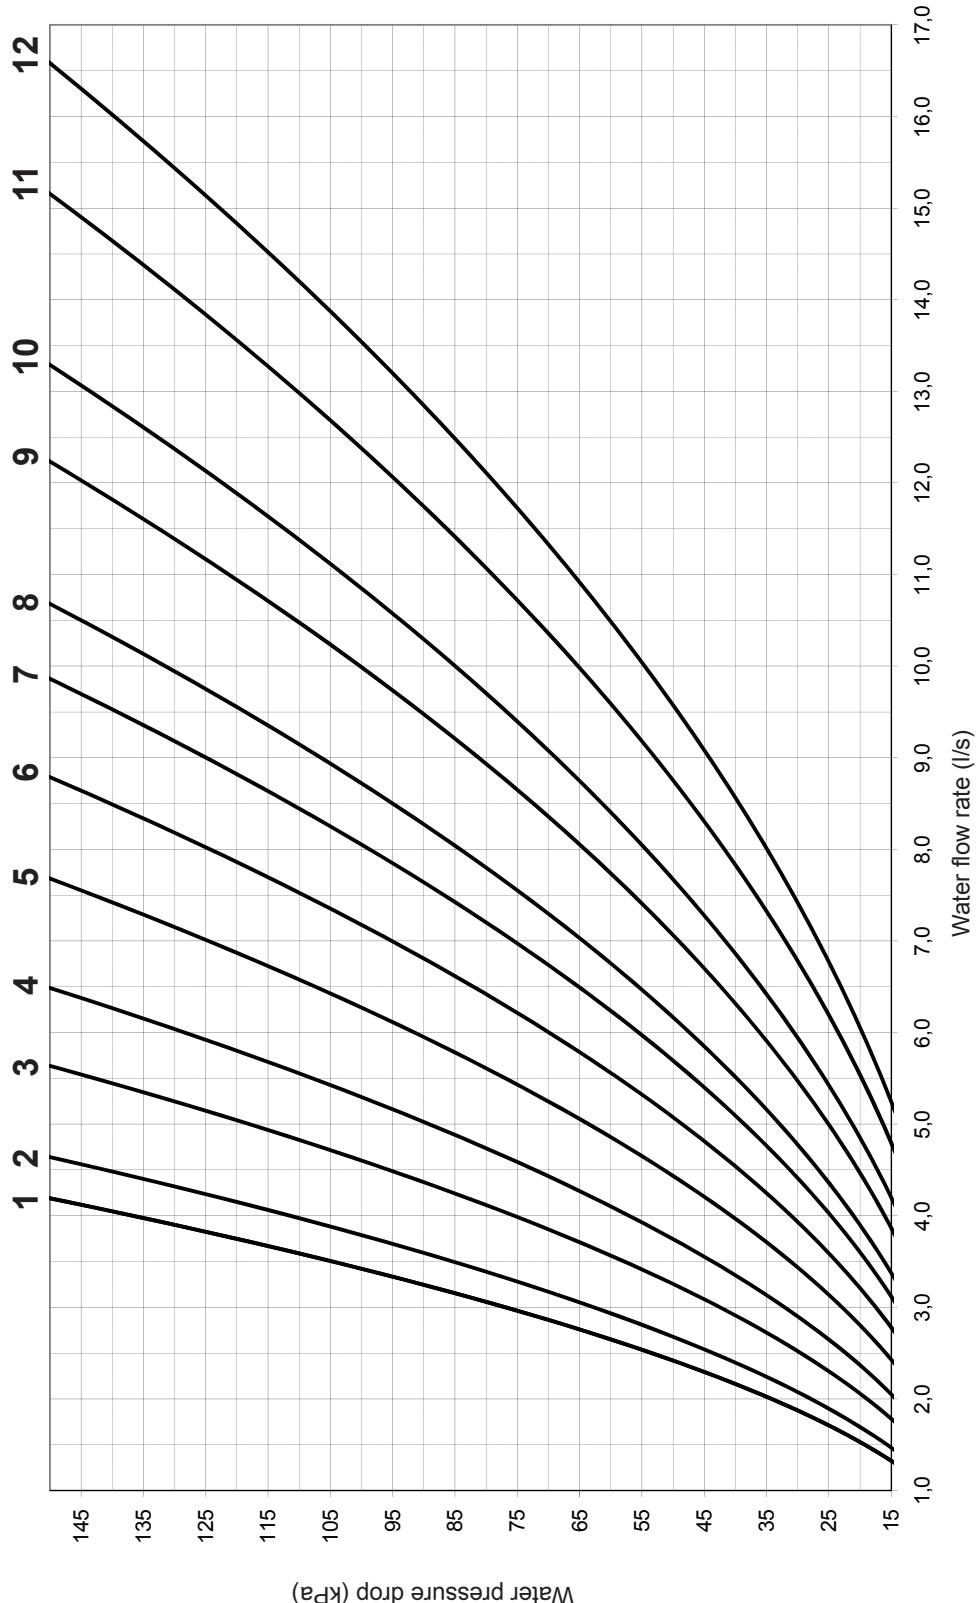

With accessory fans modulating control (brine is mandatory)

Brine is mandatory

## Plant side exchanger

The graph below illustrates the water pressure drop values in kPa depending on the flow rate in liters/second. The operating range is delimited by the minimum and maximum values given in the next table.

The graphs are referred to units operating with water at the temperature of 10°C (density 1000 kg/m<sup>3</sup>).

## WORKING HEAD

### Standard working head pumps

Working head is that at the pumping module outlet reduced by all pressure losses inside the unit.  
 The graph below illustrates for the pumping module the working head values in kPa depending on the flow rate in liters/second. The operating range is delimited by the minimum and maximum values given in the next table.  
 The graphs are referred to units operating with water at the temperature of 10°C (density 1000 kg/m<sup>3</sup>).

## DIMENSIONAL AND PHYSICAL DATA

### Overall dimensions

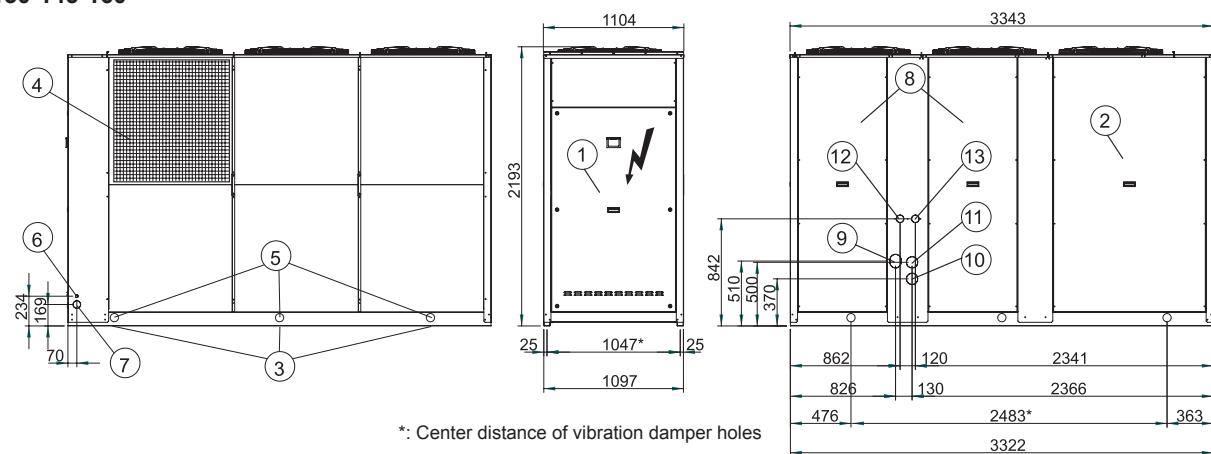

**Mod. 40-50-60-70-80**

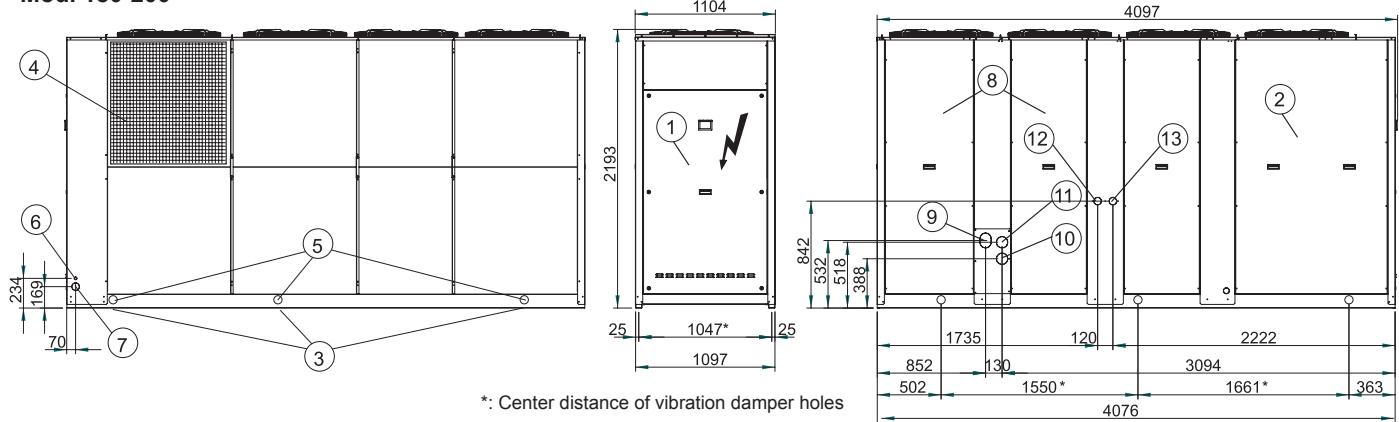

**Mod. 90-100-115**

**Mod. 130-145-160**

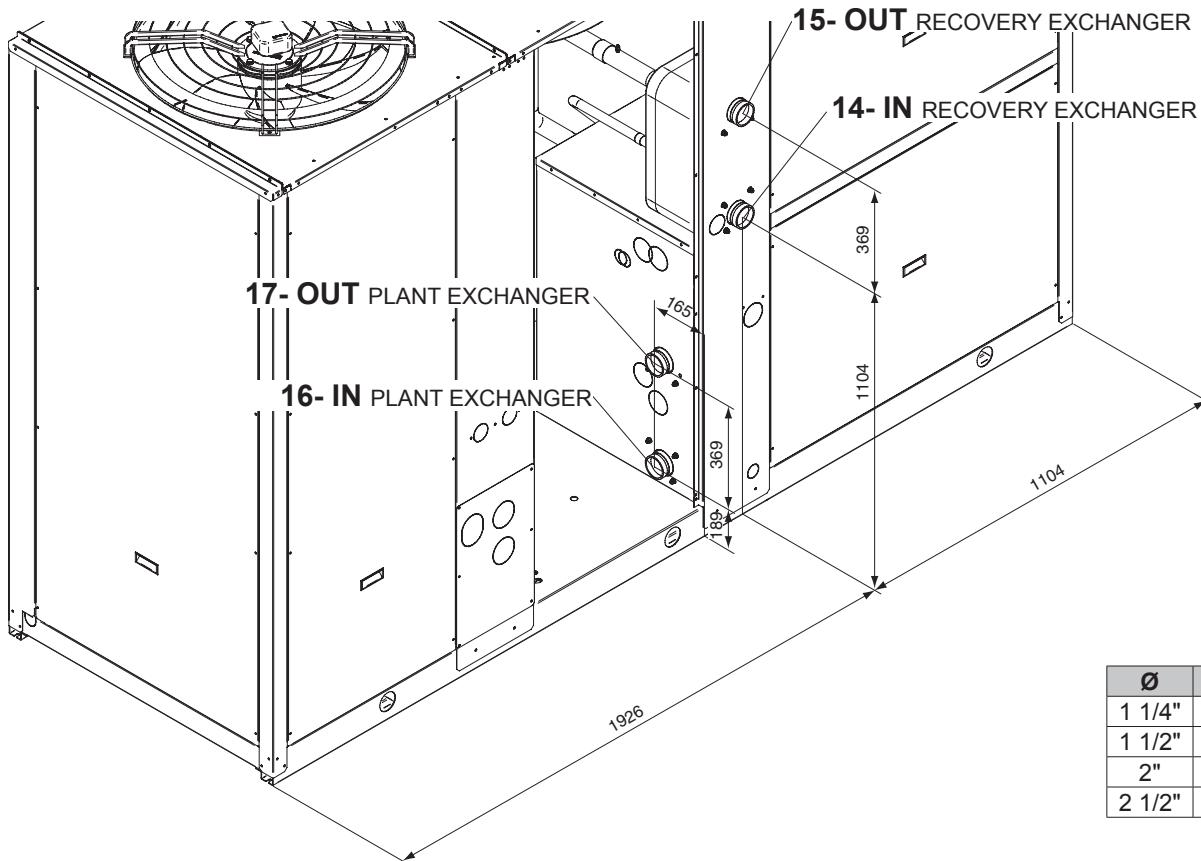

**Mod. 180-200**

## DIMENSIONAL AND PHYSICAL DATA

### Description of the components

- 1 - Access panel to electric panel's power section  
 2 - Access panel to compressor compartment  
 3 - Vibration damper fixing holes (4 pcs)  
 4 - Coil protection grilles (accessory)  
 5 - Ø 65 mm lifting holes  
 6 - Ø 22 mm input hole for accessory cables  
 7 - Ø 60 mm hole for electric power supply input  
 8 - Access panel to pump compartment  
 9 - Water inlet for AM SS  
 10 - Water inlet for PS  
 11 - Water outlet  
 12 - Water inlet for Desuperheater (VD)  
 13 - Water outlet for Desuperheater (VD)  
 14 - Water inlet for Total recovery (VR)  
 15 - Water outlet for Total recovery (VR)  
 16 - Water inlet for plant exchanger  
 17 - Water outlet for plant exchanger  
**Note (1): Victaulic connections Kit do not allow external connections.**

## DIMENSIONAL AND PHYSICAL DATA

### Minimum space required for operation

To correctly install the unit, comply with the measurements for the free area that must be left around the unit, as shown in the figure. This will ensure good air circulation, allow the unit to operate correctly and facilitate future maintenance work.

The distances must be doubled if the unit is to be installed in a pit.

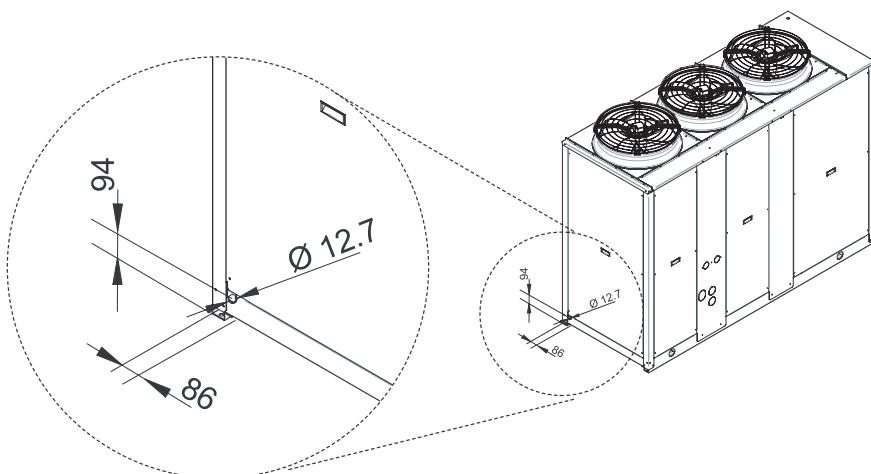

**NOTE.** Allow for an uncluttered area of not less than 2.5 meters above the unit.

Mod.	40÷115	130÷200	UM
E	1600	2000	mm

### Position of condensate drain

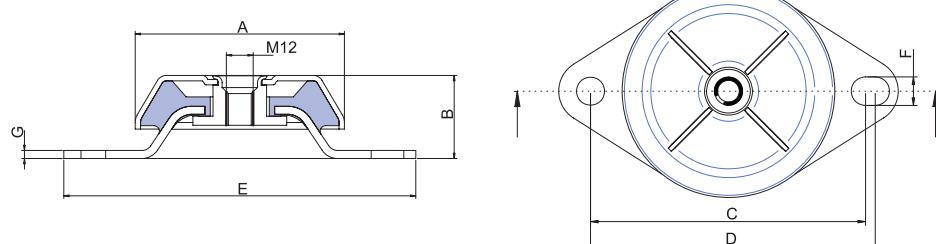

The condensate tray (if present) must have a suitable drain trap to prevent spilling of water during operation.

### Vibration-damper installation

To prevent the operating unit from transmitting vibrations to the bearing structure, vibration dampening materials should be inserted under the bearing points.

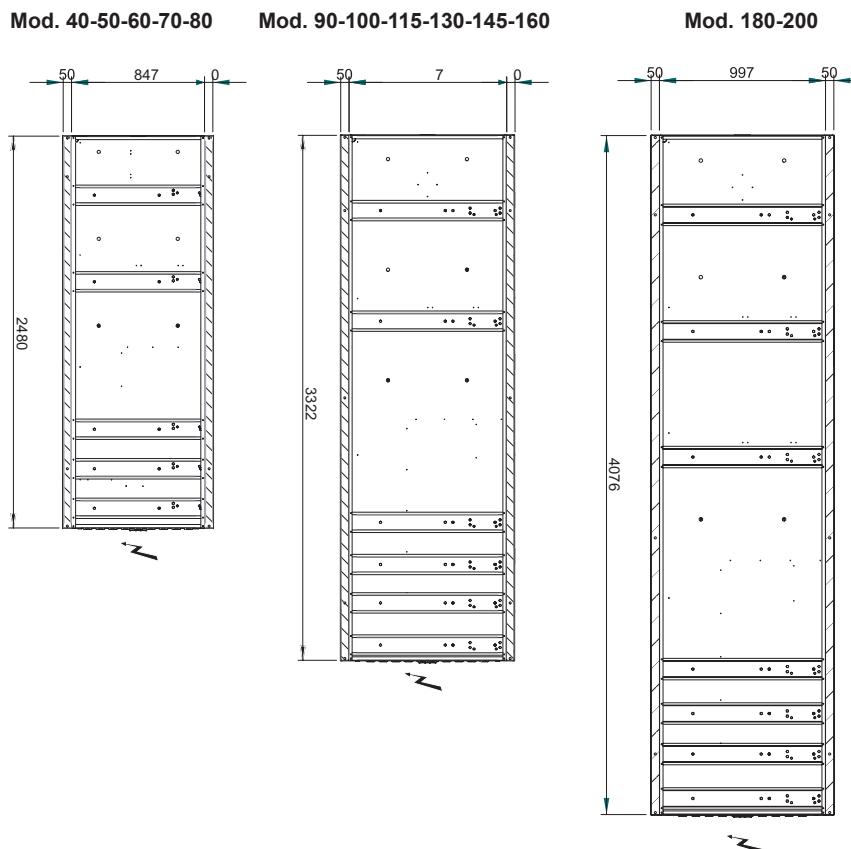

The unit can be supplied with the rubber or spring vibration dampening accessory. This must be mounted by the installer.

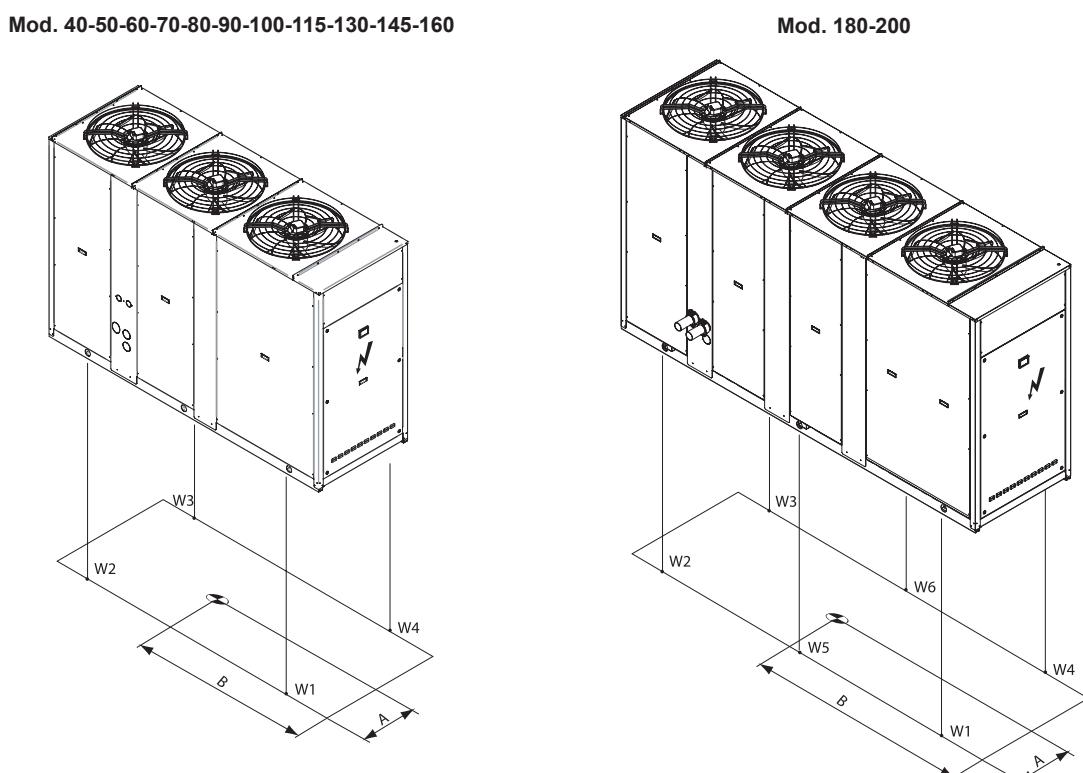

Unit	Mod.	A	B	C	D	E	F	G	UM
Unit without tank	40-80	95	35	122	124	150	10	3	mm

## RECEPTION AND POSITIONING

### Inspections on arrival

As soon as the appliance is consigned, it is essential to make sure that all the ordered items have been received and that the shipment is complete. Carefully check that the equipment has not been damaged. If visible damage is discovered, immediately inform the haulage contractor and write "Collected with reserves owing to evident damage" on the consignment note.

Delivery ex works means that, as established by law, reimbursement of any damages is at the insurance company's charge.

### Safety prescriptions

Comply with the current safety regulations concerning the equipment to use when handling the unit or the required ways of operating. Use single protection devices as goggles, gloves, helmets... when handling the unit to avoid risk of injuries. Check the weight of the appliance before proceeding with the moving and handling operations.

### Handling

Plan the handling activity verifying:

- Weight of the unit indicated on the data plate of the appliance and in the section "**DIMENSIONAL and PHYSICAL DATA**" of this manual
- Lifting capacity of the equipment that has to be used appropriate to the weight of the unit
- Type and dimensions of the unit
- Center of Gravity position and the availability of straps / ropes or other devices able of positioning the lifting hook exactly at the unit center of gravity: For the CG position in transport and operation, ref. section "**DIMENSIONAL and PHYSICAL DATA**". Also refer to the labels (Part.3) identification of transport the center of gravity, applied on all 4 sides of the base.
- State and physical characteristics of the place where the unit has been handled (yard dirt, asphalted square, etc.).
- State and physical characteristics of the destination place (roof, yard, terrace, etc.).
- Length and type of the handling route with particular attention to critical points of transition such as ramps, stairs, uneven or slippery steps, doors, etc..

**Note that the handling examples shown in the drawings are indications, the choice of handling mean and method should been done considering all the factors above mentioned.**

Comply with the following instructions when lifting and positioning the appliance:

#### • Handling with a lift truck or similar

1) The unit has four wooden bases so that it can be transported in a longitudinal direction (**not sideways**).

Place something suitable in between to separate the truck from the unit in order to prevent the surfaces of the bank or electric panel from being damaged if the unit has to be moved sideways. Do not allow the unit or any of its parts to drop on to the ground. Remember that the heaviest part is the one where the compressor is installed (electric panel side Fig.1-2).

Refer to the data plates (Fig.5) that identify the center of gravity position, applied to the 4 sides of the base.

2) Position metal pipes (Part 1 Fig.3) of adequate thickness in the holes in the base of the unit for lifting.

- The end portions of the pipes must stand out by an adequate extent to permit inserting the safety devices and housing the belts for lifting.
  - Use spacer bars in the top of the unit to prevent crushing and damaging the batteries and the parts intended to cover the assembly.
  - Consult the WEIGHTS AND CENTERS OF GRAVITY DURING TRASPORT AND OPERATION section for the center of gravity position.
- Use corner protectors (Part.2 Fig.3) to avoid damaging the unit.

Fig. 1

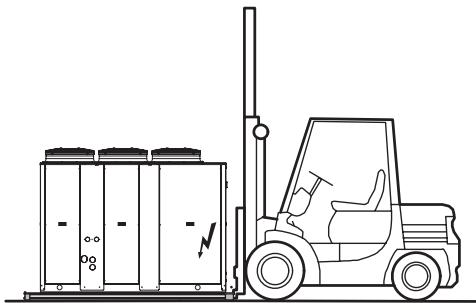

Fig. 2

Fig. 5

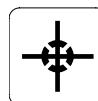

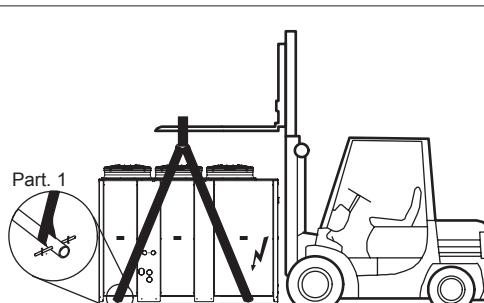

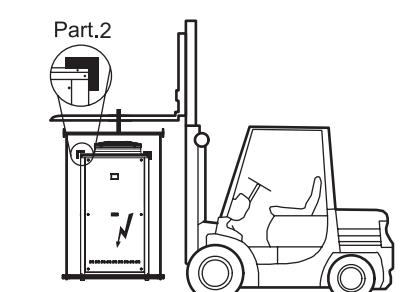

Fig. 3

## RECEPTION AND POSITIONING

### • Handling and lifting with a crane or similar

Using the brackets (Part 1 Fig.4) located by the lifting holes (refer to the "DIMENSIONAL and PHYSICAL DATA" section).  
• Consult the WEIGHTS AND CENTERS OF GRAVITY DURING TRASPORT AND OPERATION section for the center of gravity position.

NOTE: To correctly lift the machine, the belts used must be longer than 3.5 meters.

Refer to the data plates (**Fig.5**) that identify the center of gravity position, applied to the 4 sides of the base.

Use corner protectors (Part.2 Fig.4) to avoid damaging the unit.

Fig. 4

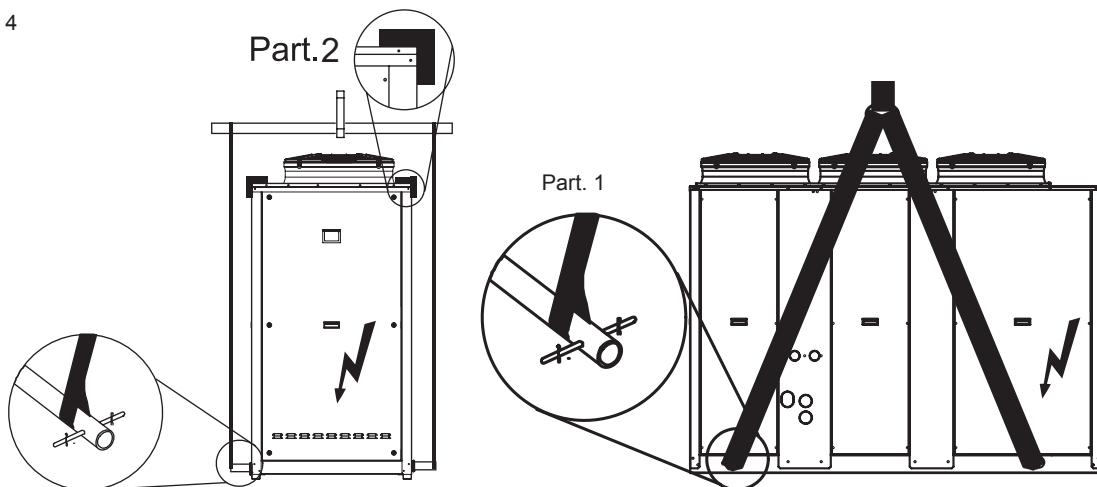

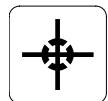

Fig. 5

**Make sure that the appliance is handled with care and without jolting as rough treatment could damage the functional parts of the unit.**

### **WARNING:**

To safeguard persons and property, read the information on the packing that covers the unit before handling. Also make sure to:

- Handle the unit with care
- Do not stack other objects on top of the unit

### **Storage**

The units must be stored in a dry place, sheltered from the sun, rain, sand and wind.

Comply with the storage conditions given below:

- Do not stack the units
- Maximum temperature = 60°C
- Minimum temperature = -10°C
- Humidity = 90%
- Avoid placing the units packaged with thermoretractable protection under the sun since the pressure inside the refrigerant circuits can increase up to values such as to open the safety valve.

### **Packing removing**

Recycle and dispose of packing material in conformity with local regulations, be extremely careful not to damage the unit.

## RECEPTION AND POSITIONING

### **Positioning**

Before positioning please consider the overall dimensions and the technical requirements of the system and the unit, electric and hydraulic connections and any air pipes/ducts or free passages.

Neglecting these aspects may decrease performance and operational life of the unit and therefore increase the operating costs and maintenance.

Units are designed to be installed **OUTSIDE** and in fixed positions.

The unit is designed to be installed outside and in a fixed location and accessible only by qualified and authorized personnel.  
Safety valve (if present): the installer is required to evaluate (according to EN378-2) the need and type of pipe to piped outlet in accordance with local regulations.

To prevent the transmission of vibrations evaluate the need for vibration dampers mounting

Before placing the unit be sure that:

- the location is in a safe accessible place
- the framework or the floor is adequate to support the weight of the unit **WORKING** (tank filled with water, etc...), please refer to weight paragraph
- support points are leveled and aligned
- the place can not be subject to flooding
- the maximum level of the snow does not obstruct the airflow to the unit

To ensure the best air circulation to the unit and thus ensure a smooth operation it is recommended to:

- avoid obstructions to air flow near or above the unit
- protect the unit from high winds that can favor or not the airflow
- protect the unit from heat sources or pollutants (chimneys, extractors...)
- protect the unit from air stratification or recirculation (avoid ducting of the fans, containment structure, high walls or corners next to the unit)

These advises if not respected can lead to a lower efficiency of the unit or to high pressure stops (in summer) or low pressure stops (in winter).

## HYDRAULIC CONNECTIONS

### General rules

A mesh filter (hole  $\varnothing < 1\text{mm}$  for plates heat exchanger  $\varnothing < 1.5\text{mm}$  for shell and tubes heat exchanger) must be installed on the unit's water inlet otherwise warranty is immediately forfeited. The filter

The filter performs the function of blocking any foreign matter in the system's plumbing circuit (shavings, machining debris, etc.) limiting or avoiding possible problems of fouling (that decreases the heat exchange coefficient), erosion, and clogging

The clogging and fouling of the exchanger can lead to a reduction of the water flow rate and. In the case that the exchanger works as evaporator- of the evaporation temperature: these 2 factors can cause the icing of the exchanger

The icing event leads to the bursting of the exchanger, the inlet of water into the refrigerant circuit and so the necessity of a replacement of the main components (compressors, filters, expansion valves,. Etc.) and an accurate washing of components as refrigerant pipes, coils, etc., practically the rebuilding nearly complete of the refrigerant circuit.

The filter must be maintained clean: this is so necessary verify the cleanliness after the unit installation and checking periodically the state.

### Protection devices

Standard supply includes a differential pressure switch situated between the water inlet and outlet of the heat exchanger to avoid freezing if the water flow stops for any reason.

Activation is calibrated for a 80 mbar  $\pm 5 \Delta p$ , while resetting occurs with a  $\Delta p$  of 105 mbar  $\pm 5$ .

The differential pressure switch opens the contact and shuts down the compressors when the water flow ratey decreases and  $\Delta p \leq 80 \text{ mbar } \pm 5$ .

The differential pressure switch closes and therefore the unit can restart when the water flow rate increases and  $\Delta p \geq 105 \text{ mbar } \pm 5$ .

- Standard supply includes an antifreeze heater placed between the external thermal insulation and the shell of the exchanger and controlled by the main electronic controller of the unit in order to protect the evaporator full of water (but not the pipes) from the winter icing when the unit is in stand-by mode. The exchanger is protected down to an outdoor air temperature of -20°C.

**NOTE the antifreeze protection only work if the unit is electrically connected the standby period.**

It is recommended to install a water paddle flow switch at the water inlet of the unit (it can be supplied as accessory or option): the water paddle flow switch has to be electrically wired in series with the differential pressure switch.

It is mandatory to calibrate the trip out of the water paddle flow switch at a water flow rate value higher than the minimum water flow rate admissible for the exchanger (re. section Pressure Drop).

### Tips for a successful installation

For a correct design and installation of the hydraulic plant comply the local laws governing safety matters and sound...

The following information is suggestion for a correct installation of the unit:

- Before connecting the unit to the system wash adequately the pipes using clean water, filling and emptying and cleaning the filters. Only after that proceed connecting the unit to the system; this operation is crucial to ensure proper start-up without the need to have repeated stops to clean the filter, with the possible risk of damage to heat exchangers and other components.
- Check by qualified personnel the quality of the water or of the mixture used; avoid the presence of inorganic salts, biological load (seaweeds, etc.) suspended solids, dissolved oxygen and the pH. Water with inadequate characteristics can cause a pressure drop increase due to a rapid fouling of the filter, energy efficiency decrease and corrosive symptom increase that can damage the unit.
- The pipes must have the least possible number of bends to minimize load losses and must be adequately supported in order to prevent the connections of the unit from being excessively stressed.
- Install on-off valves near components that need to be serviced to isolate them when maintenance work needs to be done and to allow them to be replaced without having to discharge the system.
- Before isolating the pipes and charging the system, carry out preliminary inspections to make sure that there are no leaks.
- Isolate all the chilled water pipes to prevent condensation from forming along the pipes themselves. Make sure that the material used is the steam barrier type, failing this, cover the insulation with an appropriate protection. Also make sure that the air venting valves can be accessed through the insulation.
- Do not forget to install or at least allow for the installation of pressure and temperature reading instruments on the inlet and outlet parts of the hydraulic circuit. These instruments will allow you to monitor the operation of the system.
- The circuit can be kept under pressure by means of an expansion tank and a pressure reducer. A plant filling unit can also be used in order to automatically charge the system and keep it at the desired pressure if it drops below a certain pressure value. Install manual or automatic values in the highest point of the system to eliminate air from the circuit.

Fit manual or automatic valves at the highest point in the circuit in order to vent air from the circuit.

- the water connections are Victaulic-type joints for hooking up to the unit.

The joints allow the pipes to expand due to changes in temperature and in addition the elastomer gasket and the specified play help insulate and absorb noise and vibration.

- If vibrations dampers are installed under the unit, it is recommended to use flexible couplings before and after the water circulation pump and near the unit.

- Install on the outlet of the unit a suitable valve able to regulate the water flow.

- Avoid that the weight of the connection pipes pushes on the hydraulic connections of the unit using approved supports.

Check that plant components are suitable to bear the maximum static pressure (it depends on the height of the building).

### Precautions for the Winter

---

The water could freeze and damage the exchanger of the unit and other parts of the system during the winter period, if the system was to remain at a standstill. This problem can be obviated in 3 different ways:

1. Drain the system completely, taking care to drain the plate exchanger (in order to drain the unit's piping system completely, open the water drain ball valves and the air vent valves, open any valves closed).
2. Operate with glycol water taking account, depending on the % of glycol, of the factor of correction of the refrigerating capacity, power input, water flow rate and losses of head (see table on following page)
3. If it is certain that the unit will always be powered throughout the winter, the unit is able to protect itself from freezing, down to a temperature of -20°C: this is possible thanks to an antifreeze electric heating element installed on the plate exchanger and intelligent control of the water pump that must be governed by the microprocessor board (see the "Electric Connections" section). If the unit is fitted with a Storage tank, solution no. 3 requires installing the tank antifreeze heating element accesso.

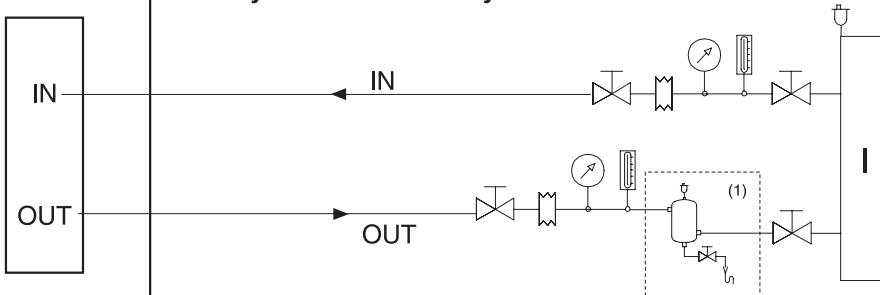

## HYDRAULIC CONNECTIONS

### Basic diagram Standard Unit VB [PLANT SIDE WATER CIRCUIT]

The following figures represent connections to the plant side exchanger.

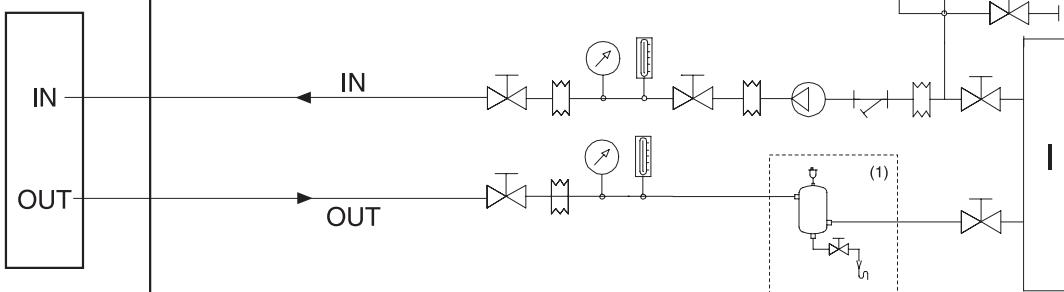

**IMPORTANT:** There must be a constant flow of water to the exchanger. With accessory primary-secondary pumping module MP PS STD is mandatory to install a water filter in the secondary circuit immediately after of the water tank.

#### VB + hydronic kit accessory MP AM and MP SS

#### VB + hydronic kit accessory MP PS and only tank SAA

CHILLER

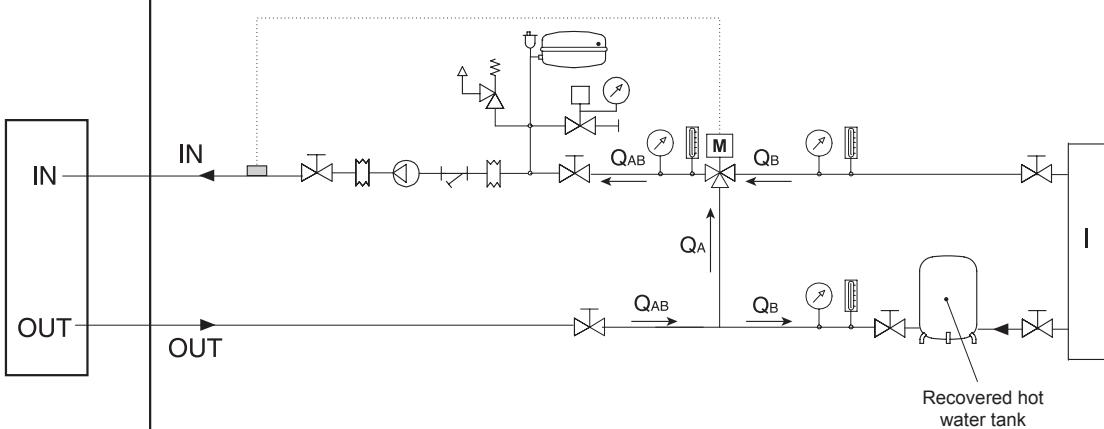

### Basic diagram for units with Recovery [RECOVERY WATER CIRCUIT]

#### The basic diagram given is valid for VD-VR version

The figure below shows the basic diagram of the system with the heat exchanger used for recovering partially heating power that would otherwise be disposed of in the air.

**IMPORTANT:** The water flow to the heat exchanger must be constant, it is required to install a water filter upstream of the exchanger.

(1): Component not required if the unit is equipped with the "Water storage tank" accessory. Installation of this accessory is recommended if the unit is without it.

I = User system

Pressure gauge	Pump	Air vent valve	Water filling unit
Thermometer	Filter	Safety valve	Three-way driven valve
On-off and/or water flow rate regulating valve	Tank	Coupling	Recovery water flow inlet probe
Monitoring electronics (governor)	Expansion tank		

## HYDRAULIC CONNECTIONS

### Air vent and water drain

On the plumbing circuit feeding the unit, especially when equipped with the standard pipe kit, the installer must fit an appropriate number of valves (manual or automatic) at the top of the circuit in order to vent any air in the plumbing system. In the same way, he must install a water drain valve in order, when necessary, to drain the unit's plate exchanger completely (especially during the winter in order to prevent freezing that would seriously jeopardize the operation of the unit). For units with the complete pipe kit there is an air vent valve on the top pipe (water inlet) and a water drain valve on the bottom pipe (water outlet). See "Accessories and options" section.

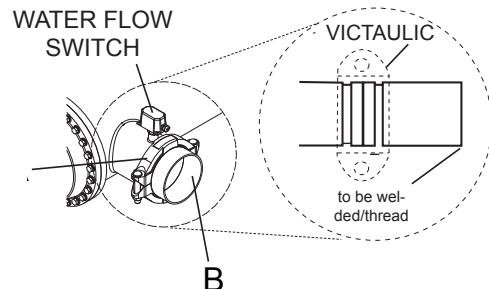

### Piping connection with Victaulic couplings and Water flow switch

It is composed of two Victaulic type quick couplers (Fig. 1-A) comprehensive of union (Fig. 1-B) and seal not installed (supplied with the unit). The unions are supplied to be welded on the end. Here we give the instructions to follow for installing the quick couplers.

Do not weld the pipe with Victaulic connection joint attacked since the gasket may be damaged irreparably.

Note:

Supplied as optional (see "ACCESSORIES AND OPTIONAL EQUIPMENT").

### Valve regulating diagram valve

To prevent problems from occurring when the unit is started with very cold water, you are strongly advised to install a mixer valve as shown in the diagram.

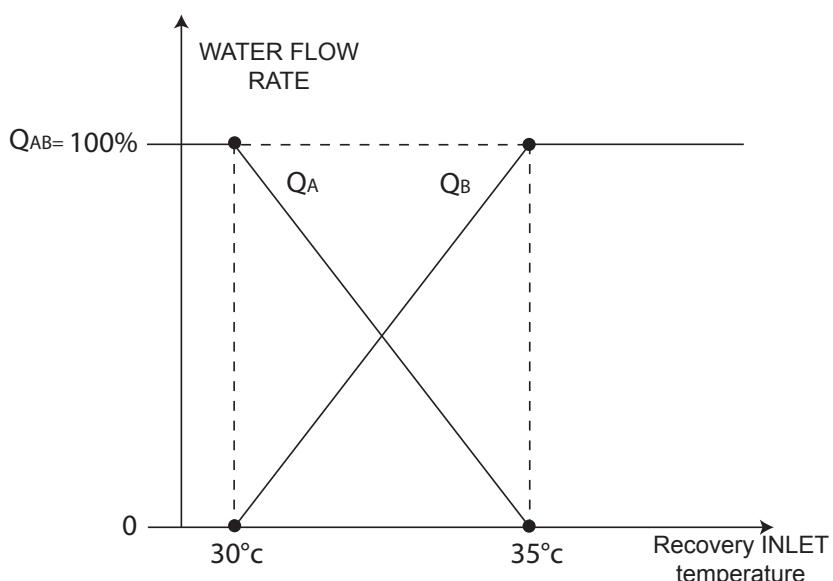

The valve must be regulated to suit the temperature at which the water flows into the desuperheater (see diagram): the graph on the right shows the type of adjustment to use.

Water connections must be performed carefully as for the evaporator (filter, circuit washing, etc.)

Perform all necessary interventions to avoid RISK OF FREEZING (tubes insulation, emptying of circuit, addition of glycol, anti-freeze resistances).

Water temperature can reach high temperatures (up to 100°C for VD unit, up to 65°C for VR unit), therefore:

- avoid RISK OF BURNS by adopting the necessary precautions (insulations of tubes, temperature detecting station on water if the sanitary use is foreseen, etc.).
- install safety valves and specifically dimensioned expansion tanks in the hydraulic circuit.

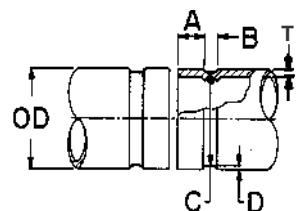

## HYDRAULIC CONNECTIONS

ISO-G	DN(mm)	EXTERNAL DIAMETER OD(mm)	A	B	O	D	T
1"	25	33.7	15.875	7.137	30.226	1.600	1.651
1 1/4"	32	42.4	15.875	7.137	38.989	1.600	1.651
1 1/2"	40	48.3	15.875	7.137	45.085	1.600	1.651
2"	50	60.3	15.875	8.738	57.150	1.600	1.651

6"	150	168.3	15.875	8.738	163.957	2.159	2.769
8"	200	219.1	19.050	11.913	214.401	2.337	2.769

### 1) Pipe groove inspections

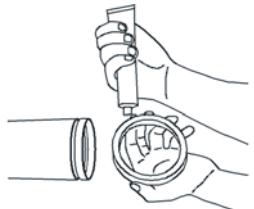

Check the depth and diameter of the grooves and their distance from the pipe ends. Make sure that the work has been carried out with care and that the end surface of the pipes is smooth and not ovalized. Make sure that there are no notches, burrs or other imperfections that could impair the tightness. Groove dimensions in mm A=16-B=8-C=57.2-D=1.6

### 2) Checking the seal and relative lubrication

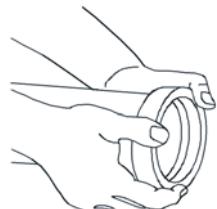

Make sure that the type of seal used is compatible with the nature and temperature of the fluid. Signal green EPDM seals are used.

Apply a film of grease to the seal: on the back, on the side flanks and on the inner lips that contact the pipe. Work in conditions of the utmost cleanliness as particles of dirt could damage the seal. Always and only use synthetic grease. Greasing makes it easier to fit the seal on the pipe and improves the tightness. It also allows the seal to slide within the connection, avoiding tensions and projections near the bolts.

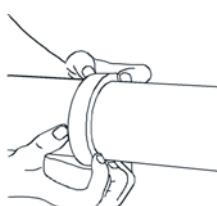

### 3) How to fit the seal

Fully insert the seal into the end of a pipe. Make sure that the seal lips adhere to the pipe itself.

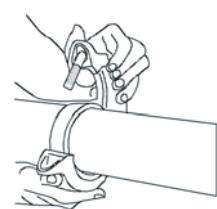

### 4) Alignment

Align the pipes and move their ends near to each other. Now push the seal, centering it on the two pipe ends. The seal must remain inside the connection.

### 5) Joint assembly

Remove one bolt and loosen (without removing) the other one. Seat part of the body of the joint at the bottom, between the pipe ends, inserting and edges of the grooves. Now seat the other part of the body at the top, on the two ends, and close the joint. Make sure that the parts of the body of the joint touch each other.

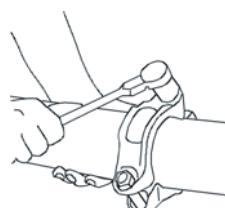

### 6) Nut torquing

Fit the previously removed bolt back in place and tighten both nuts by hand. Now torque them with the relative wrench, tightening them alternately a few turns.

#### WARNING:

If one nut is fully tightened at a time, the seal could slip between the jaws of the opposite side of the joint.

## MAXIMUM VOLUME OF WATER

### Maximum volume of water in the system with wet module

Before filling the water system, it is advisable to consider the type of installation in question, i.e. check the difference in level between the wet module and user. The following table gives the maximum water content of the water supply system in liters, depending on the capacity of the standard expansion vessel supplied and the pressure at which it should be charged. The expansion vessel setting must be regulated to suit the maximum positive difference in level of the user.

Maximum setting value 600 kPa.

With a positive H of more than 12.25 meters, calculate the expansion vessel precharge value in kPa using the formula below:

$$\text{Expansion vessel precharge} = [H/10.2+0.3] \times 100 = [\text{kPa}]$$

NOTE. In case A, make sure that the user's lowest point is able to withstand the global pressure.

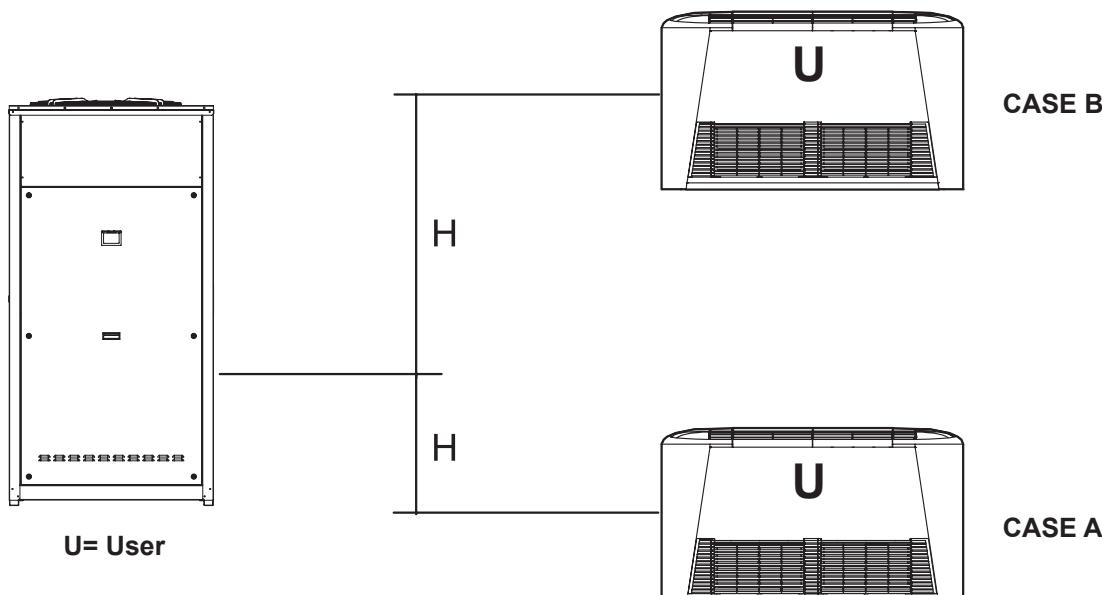

Tab.1

Model		40-50-60-70-80		90-100-110-115-130-145-160-180-200	
Expansion vessel volume (liters)		12		24	
Thermal expansion of water (10-40°C)		0.0074			
Thermal expansion of water (10-60°C)		0.0167			
H (metri)	Expansion vessel pressure (kPa)	IR	IP	IR	IP
Case A	H <0	150 (standard)	1043	461	2085
Case B	0 < H < 12.25	150 (standard)	1043	461	2085
	15	177	980	435	1960
	20	226	866	384	1732
	25	275	753	334	1505
	30	324	640	283	1279
					566

**NOTE:** If the unit operates with brine, calculate the real volume of the system by taking into account the corrective factors for the volume of the system given in the table below.

### Corrective factors per total maximum volume of the system with brine

% of brine	0%	10%	20%	30%	40%
Cooling Mode	1,000	0,738	0,693	0,652	0,615
Heating Mode	1,000	0,855	0,811	0,769	0,731

## ELECTRICAL CONNECTIONS

### **General rules**

The appliance must be wired in compliance with the laws in force in the country in which it is installed. The units are supplied fully wired in the factory and pre-engineered for connection to the electricity main. The electric panel is made in compliance with the technical standards in force in the European Union.

### **Structure of the electric panel**

All the electrical components are contained in a closed casing protected against the atmospheric agents and inspectionable by opening the front door after removing the front panel. The door for accessing the power section is locked by the mechanism. Access for the supply cables and earth cable (PE) is permitted through the opening on the bottom of the electric panel.

### **Composition of the system**

The system comprises an electromechanical part consisting of the power circuit, with disconnecting device, contactors, fuses or thermal cutouts, transformer, and another part comprising the Microprocessor control system.

**NOTES: REFER TO THE WIRING DIAGRAM SUPPLIED WITH THE UNIT FOR THE LAYOUT OF THE ELECTRIC PANEL.**

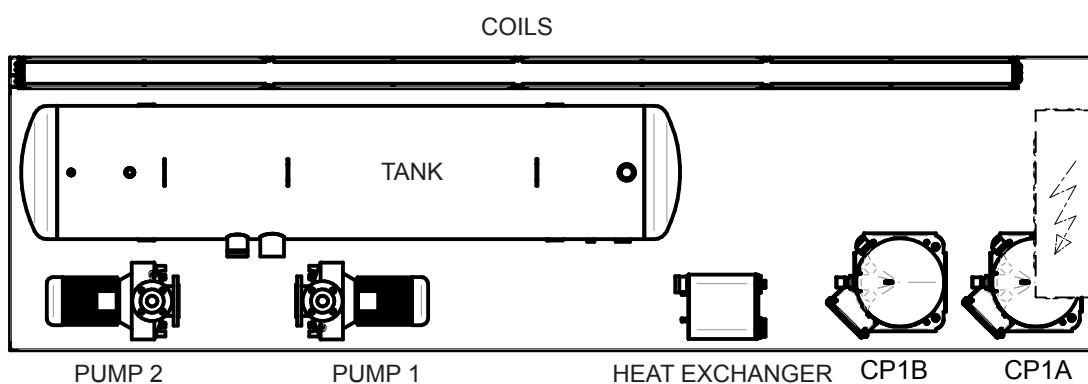

### **Electrical connections**

All electrical connections must be carried out by qualified personnel in the absence of electric power. The table below gives the electrical specifications of the different constructional configurations of the units.

## ELECTRICAL CONNECTIONS

### 1) Connection to the electricity main

#### • Power supply line:

The unit's power supply line must be laid by following a clearly defined route in order to make it as correct as possible any without any breaks. Pass the line through the opening on the button of the electrical panel. Secure the line integral with the structure of the unit. Then continue inside the panel and connect the conductors directly to the input terminals of the main disconnecting device of the unit. The characteristics of the main lines should be determined by qualified personnel specialized in the design of electrical systems, according to your national regulations and standards.

#### • Power supply system:

The power cables of the unit's supply line must be taken from a system of symmetrical three-phase voltages (difference between voltage max 2%) and of a separate protection conductor.

$$\begin{aligned}V &= 380 \div 415 \text{ V} \\f &= 50 \text{ Hz}\end{aligned}$$

#### • Protection on supply side:

An automatic switch must be installed on the supply side of the side in order to protect against any overcurrents and indirect contacts that could occur when the unit is operating.

It is advisable to install an automatic current limiter switch in order to limit the effective short-circuit current in the connecting point of the unit. This allows a protection device with a lower breaking capacity than that required in the connection point to be sized like the main circuit-breaker of the unit.

The line and switch must be coordinated in compliance with the current laws governing electrical safety matters, regarding the type of installation and environmental conditions in which the unit must operate.

#### • Protection conductor (ground wire):

The protection conductor from the feeder line must be connected straight to the ground screw identified by code "PE", which ensures the equipotential connection of all metal grounding points and structural parts of the unit.

#### • Signals and data lines

Do not exceed the maximum allowed distance of the cable as shown in the wiring diagram. Put cables away from power lines with a different voltage or emitting electromagnetic noise, if really necessary do not to put in parallel but only cross with these cables to 90°. Do not put cables near equipment that can create electromagnetic interference (antennas, speakers, radio repeaters etc ...). Any shielding of the cable must be connected to a ground without noise, while preserving the continuity across the total length of the cable.

#### • Connection

Always refer to the wiring diagram supplied with the unit. Verify that the network has characteristics corresponding to the data shown on the nameplate of the unit. Before starting work, verify that the switching device at the start of the line power unit is open, locked and a warning sign shown. Make the connection to the ground first that the others phase; protect the wires using cable properly fitted. Before powering on the unit, ensure that you have restored all the protections that were removed during work on connection.

### 2) Electric panel

#### • Protection degree:

The electric panel casing is made from sheet metal and has **IP54** protection rating at the doors directly accessible from the outside. The other parts of the casing guarantee a protection degree that is at least equivalent to **IP22**, as established by the current laws in force: this has been achieved since the panel has further protection against the penetration of solid foreign bodies and atmospheric agents thanks to the unit structure in which it is housed.

#### • Starting and stopping function:

The red handle on the panel door directly acts on the main circuit-breaker. The handle also acts as a door lock since it ensures that the unit is only powered when the door is shut. The stopping function carried out by the main circuit-breaker is classified as type "0" since the unit is stopped by immediately cutting off the power supply.

### 3) Reference standards

• The provisions established by the following Directives have been complied with to ensure the safety of the electrical products placed on the European Union market:

- Low Voltage Directive **2006/95 EEC** which also includes the following harmonized standards:

**CEI EN 60335-1 and 60335-2-40.**

Classification:**CEI EN 60204-1.** Safety of unitry. Electrical equipment of units. Part 1: General rules.

- Directive **2004/108/EEC** concerning "**Electromagnetic compatibility**".

### 4) User connection

Inside the electrical panel is available a user terminal where you can have:

- a) pumps start-up and safety devices
- b) two user configurable inputs
- c) digital Input for water paddle flow switch
- d) integrative resistance output relay
- e) clean contact for general alarm
- f) external signal from the compressors running

Moreover, VR units contains the following terminals:

- g) pumps start-up and safety devices
- h) digital input for remote enable
- i) digital Input for water paddle flow switch

For more details refer to the wiring diagram of the unit.

## R410A PROTECTION DEVICES

### Protection devices HIGH PRESSURE

The unit is protected against risk of overpressure by means of 4 levels protection chain.

Each circuit is equipped with:

- 1) ATC (Advanced Temperature Control) if present
- 2) high pressure automatic switch connected to electronic controller
- 3) high pressure manual switch connected to compressor contactor command
- 4) high pressure safety valve

Protection devices technical data

LEVEL	1	2	3	4
Device	ATC (Advanced Temperature Control) if present	High pressure automatic switch	High pressure manual switch	High pressure safety valve
Trip out (barg)	-	41.0	43.0	45.0
Trip in (barg)	-	29.5	31.0	41.0
connected to	electronic controller	electronic controller	compressor contactor command	Discharge the refrigerant to atmosphere to reduce the system pressure
effect	Controls the cooling capacity shutting down compressors	stop the compressors and the fans of that circuit	stop the compressors of that circuit	Discharge the refrigerant to atmosphere to reduce the system pressure
reset *	Automatic	YES by keyboard if the high pressure switch has trip-in and after the solution of the problem that generates the alarm	Press the button present on the manual pressure switch  <b>CAUTION</b>	Not necessary

\*: For more details refers to section monitoring basic system.

### **CAUTION**

IN CASE OF COMPRESSORS TRIP-OUT BY MANUAL RESET HIGH PRESSURE SWITCH THERE ARE NO EVIDENCES IN THE MONITORING SYSTEM, DO NOT RESET THE PRESSURE SWITCH BEFORE YOU HAVE DONE THE FOLLOWING STEPS:

- 1) SHUT DOWN THE UNIT USING THE OFF BUTTON
- 2) THEN RESET THE HIGH PRESSURE SWITCH

### Protection devices LOW PRESSURE

LEVEL	1	2
Device	Low pressure transducer	Low pressure automatic switch
Trip out (barg)	2 bar	2 bar
Trip in (barg)	4 bar	4 bar
connected to	electronic controller	electronic controller
effect	stop the compressors of that circuit	stop the compressors of that circuit
reset *	YES by keyboard after the solution of the problem that generates the alarm	YES by keyboard if the low pressure switch has trip-in and after the solution of the problem that generates the alarm

### Protection devices DISCHARGE TEMPERATURE (if installed)

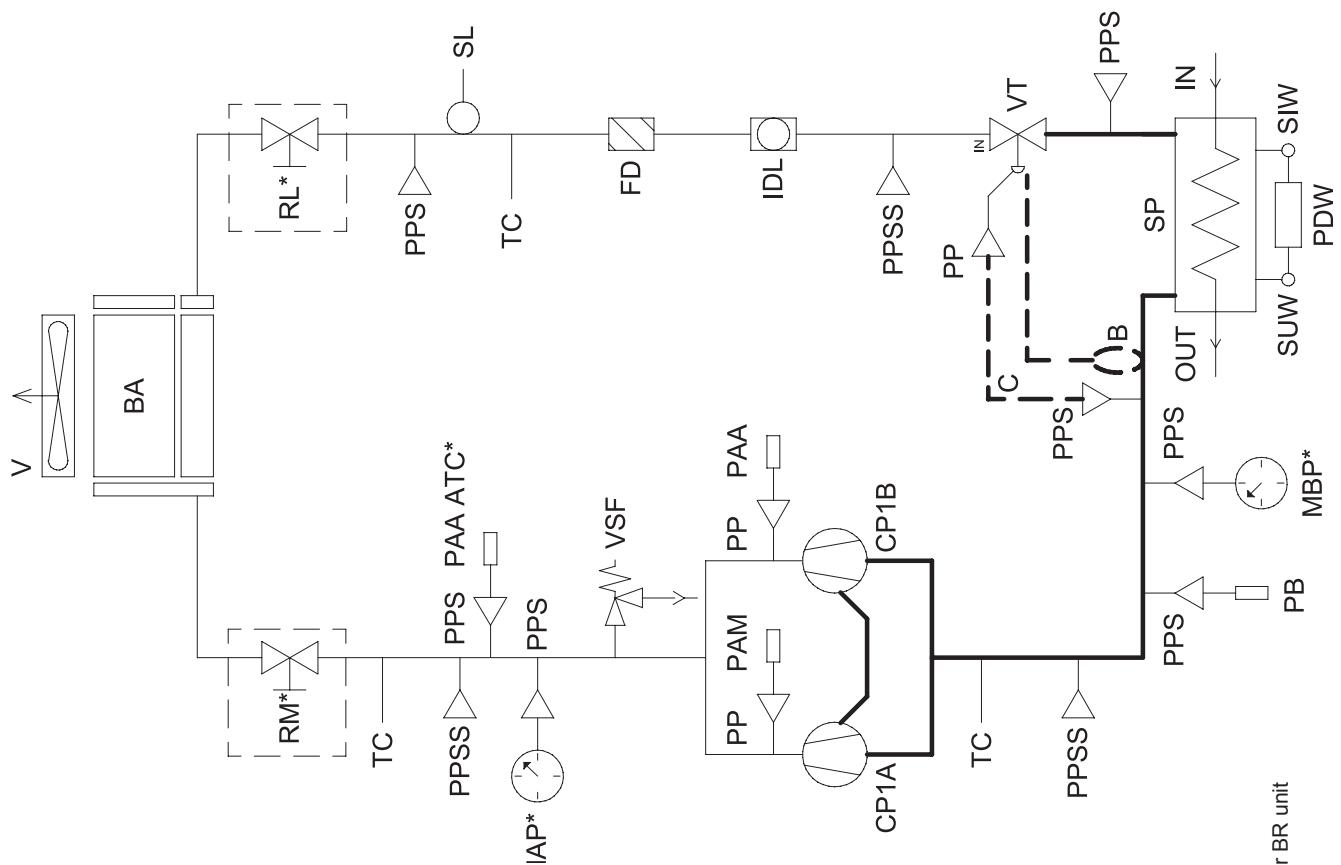

LEVEL	2
Device	Discharge Temperature
Trip out	135°C
Trip in	120°C
connected to	electronic controller
effect	stop the single compressor
reset *	YES by keyboard after the solution of the problem that generates the alarm

\*: For more details refers to section monitoring basic system.

## USER INTERFACE

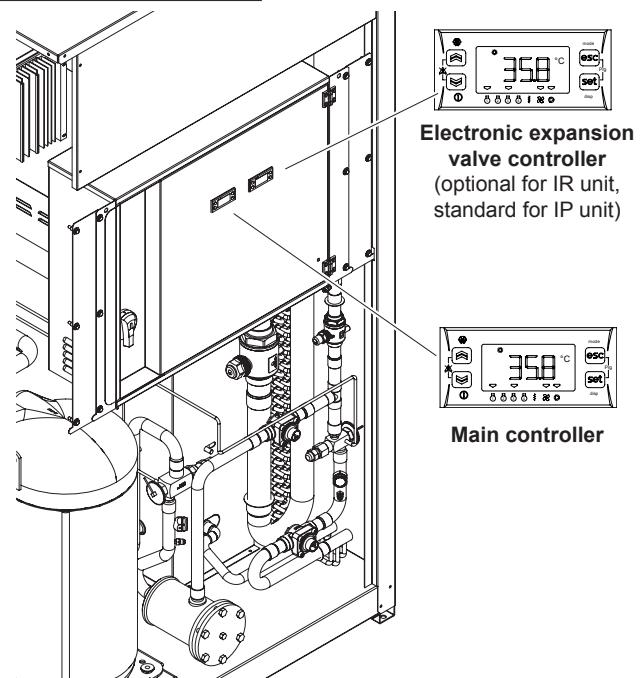

### Keys

The unit is managed by a **microprocessor controller** to which all the loads and control devices are connected by means of a terminal block. The user interface comprises a display and four buttons with which it is possible to show and possibly modify all the unit's operation parameters. The interface, located in the front part of the unit and accessible from the outside, is protected by a transparent plastic door. A remote control having all the same functions as the interface fitted on the unit is available as an accessory.

Every button provides for :

- **a direct function :** indicated on the button itself and obtained by pressing the button
- **an associated function :** indicated on the front of the instrument at the corresponding button and obtained by prolonged pressing (3 seconds) of the button
- **a combined function :** obtained by pressing 2 buttons at the same time

**ON/OFF - STAND-BY OF THE UNIT:** see paragraph "Functions available for the user - ST-BY of the unit".

Button		Direct function	Associated function	
	UP	Increase value of selected parameter Scroll menu up		Manual defrost
	DOWN	Decrease value of selected parameter Scroll menu down	-	-
	ESC	Go to menu higher level without saving the modification	mode	Access the "Operation mode" menu <sup>(1)</sup>
	SET	Go to menu higher level and save the modification Go to menu lower level Access the "Status" menu	disp	Changing the display value
	TUTTI	Alarm deactivation	-	-

Button		Combined function	
	UP + DOWN		Manual reset
	ESC + SET		Access the "Programming" menu

### NOTA:

1): key for unit on/off with mode selection (see paragraph "Functions available for the user - ST-BY of the unit").

## USER INTERFACE

### Display

The following are shown in normal display :

#### Main controller

- unit outlet water temperature (in degrees Celsius with decimal point)
- alarm code, if at least one is activated (in case of several alarms the code of the first according to the Table of Alarms is displayed)

#### Electronic expansion valve controller

- actual superheating value (in degrees Celsius with decimal point)
- alarm code, if at least one is activated (in case of several alarms the code of the first according to the Table of Alarms is displayed)

In menu mode the display depends on its position (see menu structure).

	plant pumps	Plant pumps	Amber	User activated	Safety timing

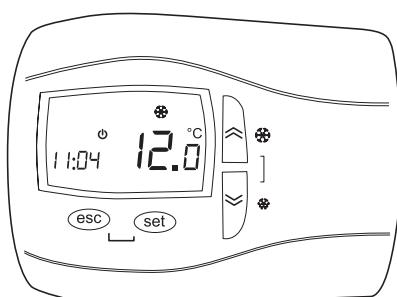

#### Remote control

Suitable for wall mounting, it has all the functions of the standard interface fitted on the unit.

The buttons, functions associated with the buttons and the display indications are the same as those provided for the standard interface.

All configuration and control operations are further facilitated by the double display which allows the name and value of the selected parameter to be shown at the same time.

Refer to the enclosed manual for the installation and connection procedures and operating instructions.

## USER INTERFACE

### Menu structure - Main controller

The control system is based on three menu with tree structure.

Menu	Access procedure	Submenu	Available functions

Press SET to go from one level to that below. Press ESC to go to higher level.

Press the UP and DOWN buttons respectively to scroll the menu up and down inside the same level.

Press the UP and DOWN buttons to modify the value of the selected parameter. Press SET to confirm the modification. Press ESC to not confirm the modification.

## INPUTS AND OUTPUTS

### Inputs and outputs

**SB655** - main controller

**SE655** - expansion board

**XVD420** - electronic expansion valve driver

UNIT	COMP.	SB655	SE655	XVD420
VB - VD	IR	x	-	-
	IR with electronic expansion valve (optional)	x	-	x
	IP	x	-	x
	IR	x	x	-
VR	IR with electronic expansion valve (optional)	x	x	x

x = Present

- = Not present

### Analog input

#### Analog inputs MAIN CONTROLLER (SB655)

DESCRIPTION		CHARACTERISTICS
AI1	water inlet probe plant exchanger	NTC temperature sensor (-50°C ÷ 99°C)
AI2	water outlet probe plant exchanger	NTC temperature sensor (-50°C ÷ 99°C)
AI3	liquid probe	NTC temperature sensor (-50°C ÷ 99°C)
AI4	ATC / outside air probe / remote ST-BY - S/W.- demand limit-economy	NTC temperature sensor (-50°C ÷ 99°C) / digital input
AI5	see AI5 on "digital inputs"	configured as digital input

- Input AI4 is factory-set as not enabled, if present ATC or SND accessory, input AI4 is pre-set by factory. Its configuration for specific use must be carried out at the time of installation according to the needs of the moment, modifying the configuration by parameter.

- Input AI5 is factory-set as neutral and its configuration for specific use must be carried out at the time of installation according to the needs of the moment, modifying the configuration by parameter.

**Modification and parameter configuration operations must only be carried out by an authorised service centre or by competent personnel.**

#### Analog inputs EXPANSION BOARD (SE655)

DESCRIPTION		CHARACTERISTICS
AI1	Recovery water inlet probe exchanger	NTC temperature sensor (-50°C ÷ 99°C)
AI2	Recovery water outlet probe exchanger	NTC temperature sensor (-50°C ÷ 99°C)

#### Analog inputs ELECTRONIC EXPANSION VALVE DRIVER (XVD420)

DESCRIPTION		CHARACTERISTICS
AI1	suction pressure transducer	electronic transducer 4-20 mA (0 barg ÷ 30 barg)
AI3	suction temperature	NTC temperature sensor (-50°C ÷ 99°C)

### Digital input

#### Digital inputs MAIN CONTROLLER (SB655)

DESCRIPTION		CHARACTERISTICS
DI1	Thermal switch compressor 1 – thermostatted delivery 1 –high pressure switch	Digital input with voltage-free contact
DI2	Thermal switch compressor 2 –thermostatted delivery 2 – high pressure switch	Digital input with voltage-free contact
DI3	Low pressure switch + sequence meter + fan thermal switch + EEV driver alarm	Digital input with voltage-free contact
DI4	Thermal switch plant pump 1	Digital input with voltage-free contact
DI5	Thermal switch plant pump 2 (if present)	Digital input with voltage-free contact
DI6	Differential pressure switch + external paddle flow switch	Digital input with voltage-free contact
AI5-IN DIG	Remote ST-BY - S/W.- demand limit-economy	Analog input configured as digital

\*refer to section alarms. ER10-ER11 for more details

Note for input DI5 thermal switch pump 2.

If only one pump is used and only one thermal switch is required, ID5 can be used as an additional multiconf. input for Remote ST-BY - S/W.- demand limit - economy.

In this way it is possible to have both the

- remote ST-BY, and

- S/W - demand limit – economy

- External probe

DI5 is factory-configured as pump 2 thermal switch. To modify the configuration, refer to the section "configurable inputs setting".

## INPUTS AND OUTPUTS

Recovery digital inputs EXPANSION BOARD (SE655)		
DESCRIPTION		CHARACTERISTICS

Ambient storage humidity (non-condensing)	30 %	10 %	90 %

# ALARMS

## Alarm activation and reset

The controller can perform a complete diagnosis of the unit, detecting all operation faults and signalling a number of alarms.

Activation of an alarm involves :

- blocking of users concerned
- signalling of alarm code on the display (in case of simultaneous alarms the one with the lowest index is displayed whereas the complete list of active alarms can be shown by accessing the "Status \ RL" menu)
- recording of event in the alarms history

Alarms that can damage the unit or system require **manual resetting** or an action by the operator to reset the controller (pressing the UP and DOWN buttons at the same time). It is advisable to carefully check the cause of the alarm and make sure the problem is eliminated before restarting the unit. In any case the unit restarts only if the cause of the alarm has ended.

Less critical alarms are **automatic reset**. As soon as the cause is eliminated the unit starts working again and the alarm code disappears from the display. Some of these alarms become manual reset if the number events per hour exceeds a fixed limit.

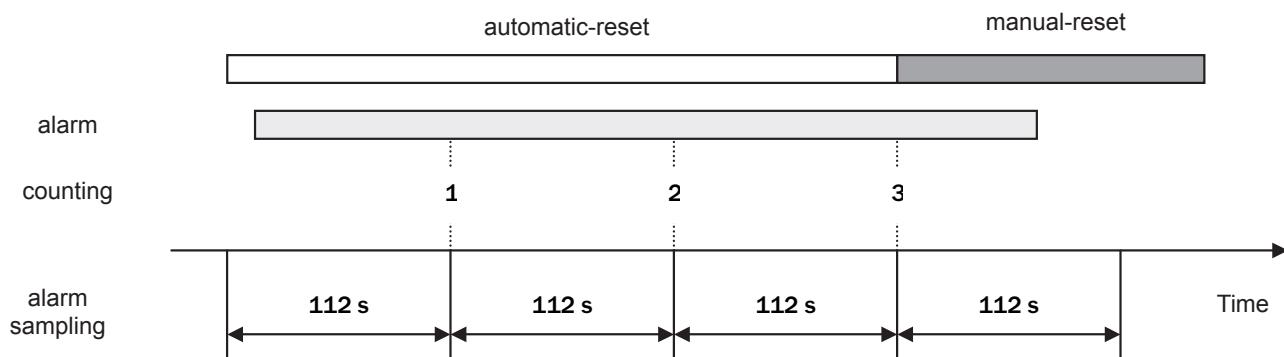

Press any button to **deactivate the alarm** : alarm signalling disappears from the display, the alarm LED starts flashing and the Alarm digital output is disabled. This operation does not affect the alarm in progress.

## Number of events per hour

The counting of events per hour is provided for some alarms : if the number of events reaches a fixed limit in the last hour, the alarm goes from automatic to manual reset.

Sampling of alarms occurs every 112 seconds. If an alarm is activated several times in a sampling period (112 seconds) it is counted only once.

Example. If an number of events per hour equal to 3 is set, it must have a duration of between 2\*112 seconds and 3\*112 seconds so that the alarm goes from automatic to manual reset.

## Alarms history

The controller enables the recording of alarms occurring during unit operation (up to a max. of 99 events). The following are memorised for each event :

- alarm code
- input time
- input date
- output time
- output date
- type of alarm (automatic or manual reset)

This information can be shown by accessing the "Programming \ EU" menu.

When the number of events memorised is more than 99, alarm E-90 is generated and the subsequent events are memorised overwriting the oldest alarms.

The alarms history can be cancelled by means of the E<sub>U</sub> function available inside the "Programming \ FnL" menu.

## ALARMS

**Alarm table**

Code	Alarm		Type of alarm	input	COMPRESSORS	FANS	PLANT CIRCUIT PUMPS	EXCHANGER RESISTANCES PLANT	AUXILIARY OUTPUT	
Er05	Low pressure + sequence meter + fans thermal switch + EEV driver alarm (if present)		A/M <sup>(2)</sup>	DI3	OFF	OFF				
Er10	Compressor 1 thermal protection	High pressure	M	DI1	OFF comp.1					
Er11	Compressor 2 thermal protection		M	DI2	OFF comp.2					
Er20	Plant circuit water differential pressure switch / paddle switch		A/M	DI6	OFF	OFF if manual reset	OFF			
Er21	Plant circuit pump 1 thermal protection		M	DI4	OFF	OFF	OFF p.1	OFF		
Er22	Plant circuit pump 2 thermal protection		M	DI5	OFF	OFF	OFF p.2	OFF		
Er25	Recovery water differential pressure switch / paddle switch		M	DIE2	OFF	OFF	ON	OFF		
Er26	Recovery pump 1 thermal protection		M	DIE3	OFF	OFF	ON	OFF		
Er30	Plant circuit antifreeze		M	AI2	OFF					
Er31	Recovery circuit antifreeze		M	AIE2	OFF					
Er45	Clock fault error		A							
Er46	Clock to be set error		A							
Er47	Remote keyboard communication error		A							
Er60	Plant exchanger inlet water probe fault		A	AI1	OFF	OFF	OFF	OFF	OFF	
Er61	Plant exchanger outlet water probe fault		A	AI2	OFF	OFF	OFF	OFF	OFF	
Er62	Liquid temperature probe		A	AI3						
Er63	Recovery exchanger inlet water probe fault		A	AI1	OFF	OFF	OFF	OFF	OFF	
Er64	Recovery exchanger outlet water probe fault		A	AI2	OFF	OFF	OFF	OFF	OFF	
Er68	External air probe fault		A	AI4						
Er80	Configuration error		A		OFF	OFF	OFF	OFF	OFF	
Er90	Recordings for alarms history exceeded signalling		M							

**Notes:**

(1) A = automatic reset, M = manual reset

(2) Only when the alarm becomes manual reset

**Er05 Low pressure – Sequence meter - Fans thermal protection - EEV driver alarm**

The alarm becomes manual reset when the number of events per hour is more than parameter  $R_L\ 12$ .

The alarm is bypassed for parameter  $R_L\ 11$  seconds from activation of the compressor or the reverse cycle valve.

**Er10 Compressor 1 thermal protection**

The manual-reset alarm intervenes in the event of activation of the compressor thermal protection or the thermostat located on the outlet of the compressor .

**Er11 Compressor 2 thermal protection**

The manual-reset alarm intervenes in the event of activation of the compressor thermal protection or the thermostat located on the outlet of the compressor .

**Er10 Er11\* Compressor 1 thermal protection - Compressor 2 thermal protection - High pressure switch (PAA)**

The manual-reset alarm intervenes in the event of activation of the compressor 2 thermal protection or the thermostat located on the outlet of the compressor 2 AND in the event of activation of the compressor 1 thermal protection or the thermostat located on the outlet of the compressor 1 and/or more likely it means the auto-reset high pressure switch (PAA) trips in.

**Er20 / Er25 Differential pressure switch - flow switch plant / recovery**

The alarm is activated if the associated digital input remains activated for at least 5 seconds and automatically resets if the digital input remains not activated for at least 3 seconds. The alarm becomes manual reset if the digital input remains activated for more than 10 seconds. The alarm is bypassed for 15 seconds from pump activation.

**Er21 Er22 / Er26 Pump thermal protections plant / recovery**

When thermal protection trip in the controller stop the pump and the unit; if the controller manages two pumps it involves the activation of the other, if both thermal protection trip in the controller stops the unit.

## ALARMS

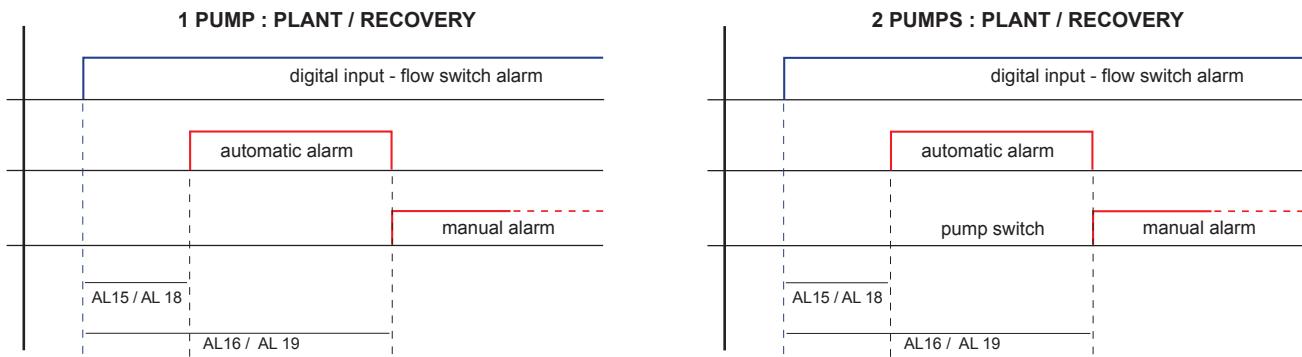

### **E-20 E-25 Flow switch / water differential pressure switch alarm**

Unit with 1 pump:

The alarm is active if the input is active for at least the time *RL 15* (plant) / *RL 18* (source). It remains automatic for the time *RL 16* (plant) / *RL 19* (source): if, during this time the alarm is deactivated the unit can restart to work, instead if remains active becomes manual.

Unit with 2 pumps:

The alarm is active if the input is active for at least the time *RL 15* (plant) / *RL 18* (source). It remains automatic for the time *RL 16* (plant) / *RL 19* (source): during this time the controller stops the working pump and switch on the other one, if the alarm is deactivated the unit can restart to work, instead if remains active becomes manual.

If there is the flow switch alarm during the first startup of the unit control the cleanliness of the water plant. Particularly during the startup a lot of impurities due to the pipes installation can be present into the hydraulic plant and if the plant was not carefully washed, despite the installation of water filters with adequate mesh size impurities as sand, chips or similar could enter into the exchangers choking them and, in worst cases, lead to a serious damage or broke for freezing (if the exchanger is working as evaporator).

### **E-30 / E-31 Antifreeze plant / recovery**

The alarm switch off the compressors, activates the heaters and the pumps (if off).

It is a very dangerous alarm: check carefully the possible cause and eliminates it before reset the alarm.

### **E-45 Clock failure**

If the clock is not working it is not possible to set time bands and the record of date and hour for the alarms present in the alarm events.

### **E-46 Alarm: clock to be set**

There is this alarm if the controller is not electrically supplied for several days.

### **E-47 LAN communication error between electronic controller (base, remote, expansion)**

There is this alarm if there is no communication between the devices connected through LAN.

### **E-60 E-61 E-63 E-64 Failure of temperature probes (plant and recovery)**

This alarm stops the unit. It could be caused for short-circuit, breakage or out of range of the probe

### **E-62 Failure of liquid temperature probe**

If the alarm is active the fans work only on-off on request (on when compressor is on). It could be caused for short-circuit, breakage or out of range of the probe. In and out defrosting are managed by the timing of compressor.

### **E-68 Failure of external air temperature probe**

If the alarm is active all controls based on this probe (i.e. dynamic setpoint or defrost) are disabled: the unit can continue to work. It could be caused for short-circuit, breakage or out of range of the probe.

### **E-80 Configuration fault**

Appears when the parameters are not set correctly.

### **E-90 Maximum number of recordings in alarms history exceeded**

Indicates that the alarms history buffer is full. Every new alarm will be memorised, cancelling the oldest alarm.

\* Note: The manual-reset high pressure (PAM) does not have reference on the control display so you can not identify it through the internal diagnostics as it acts directly on contactors, it may happen that the control display does not signal any error but the compressors are however still, in this case switch-off the unit then rearm the manual-reset high pressure switch by pressing the button located at the top of the switch.

## ALARMS

### Electrical expansion valve table alarm XVD420

Code	Driver input	Allarm	Cause	Effect	Alarm type	Alarm on main controller	Input on main controller	Troubleshooting
Er 01	AI1	Probe AI1 fault	Probe fault / shortcircuit / non connected	Valve closed	Automatic	er05	DI3	Check wiring of the probe, replace probe AI1

**Note:**

\* power off and on the driver/unit to reset

## AVAILABLE FUNCTIONS

### **ST-BY of the unit**

When the unit is powered it may be in STAND BY status (the display shows the message Stby) or ON status. It is possible to switch between ON and STAND BY by pressing (prolonged) the MODE button.

When the unit is STAND BY all the users are disabled and the antifreeze function is not activated.

### **Operation mode selection**

When the unit is ON, one of the operation modes can be selected by accessing the "Operation mode" menu.

- Cooling ☀ COOL
- Heating ☀ HEAT
- STAND BY ⏹ Stby

### **Remote ST-BY ⏹**

This function allows remote selection of the STANDBY mode. If the input is activated (contact open) the controller is in STANDBY mode and the operation mode cannot be modified from keyboard.

The function is available if one of the configurable inputs is configured for this, contact closed = unit ON (display SIW), contact open = STAND-BY (display Stby).

### **Working mode remote change-over cooling ☀ / ☀ heating**

This function allows remote selection of Cooling or Heating mode. If the input is activated (contact open) the unit is in heating mode. If the input is not activated (contact closed) the unit is in cooling mode. The operation mode cannot be modified from the keyboard (but STANDBY mode can be selected).

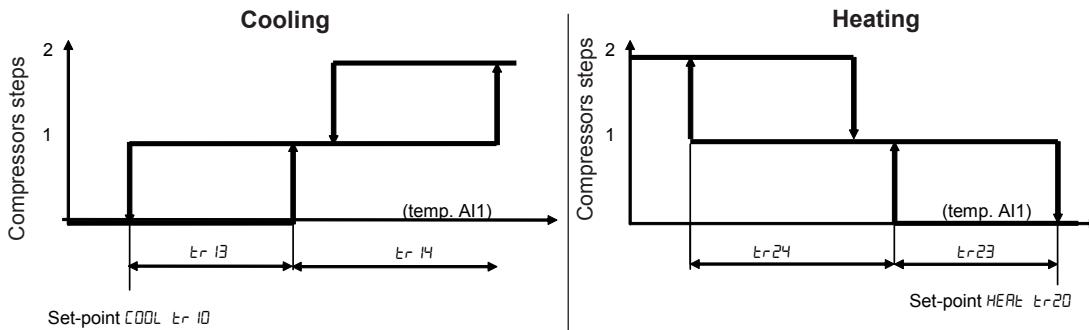

To enable this function, follow the indications in the section "configurable inputs setting".

### **Set point**

The set point value in cooling (COOL) and heating (HEAT) can be set by accessing the "Status \ Sp" menu. The purpose of the controller is to keep the water temperature at the unit inlet as close as possible to the set value, by activating the compressor according to an on-off logic.

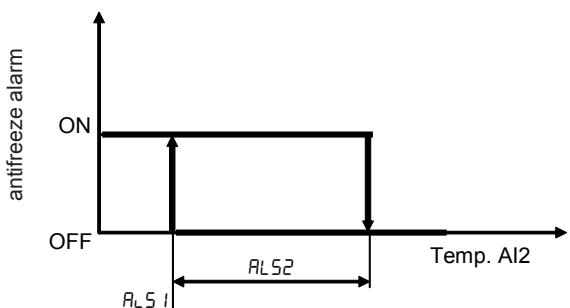

Note for heat pump mode:

It's possible to set a value for outside air temperature (parameter HP11) below which the heat pump operation is stopped (still available, if any, additional integrative heaters).

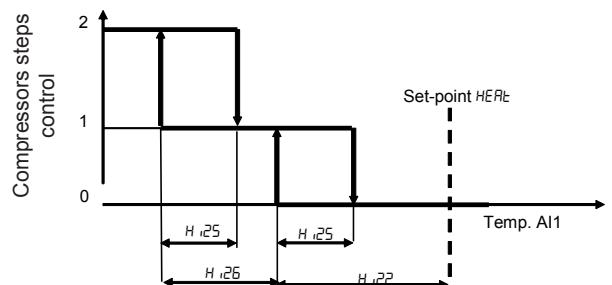

### **Antifreeze ~~~**

The plate-type exchanger is protected by activation of an electrical heating element and activation of the antifreeze alarm, occurring in sequence when the exchanger outlet water temperature reaches dangerous values. The storage tank is protected by the antifreeze heater (accessory) activated in parallel with the plate-type exchanger heating element.

### **Supplementary electrical heating elements ~~~**

The parameter H.i20 enables operation of the electrical elements supplementing the heat pump when it assumes value 1. The heating elements are activated according to a two-step logic depending on the unit inlet water temperature. When present, the heating elements also carry out a storage tank antifreeze function.

## AVAILABLE FUNCTION

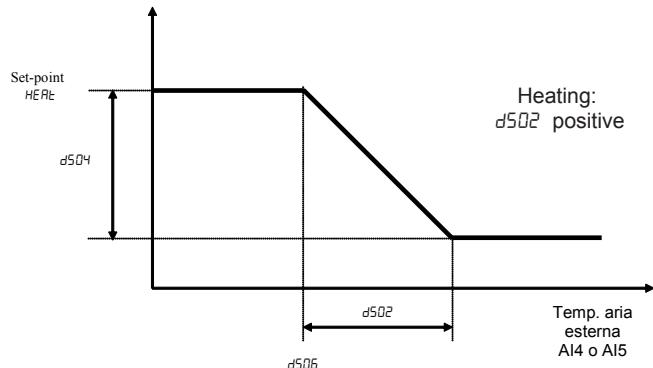

### Dinamic setpoint

The parameter  $d500$  allows the dynamic setpoint; if  $d500=1$  the setpoint is corrected as a function of external air temperature (if present). To set the external air temp follow the indications of the section "Configurable Inputs".

The activation of the dynamic setpoint is displayed by the switch-on of the led Economy on the display (money box symbol); it is possible to display the actual setpoint by the parameter  $SEt_r$ .

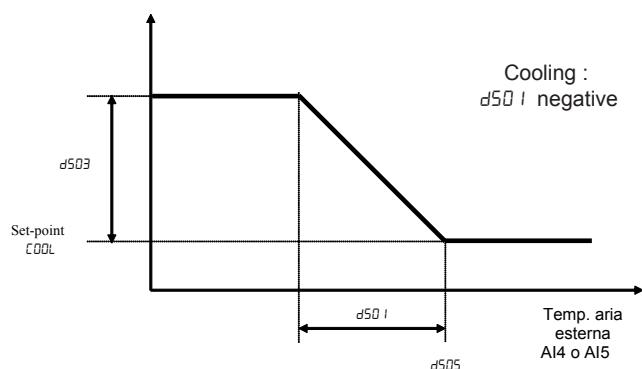

#### Dinamic setpoint in heating mode

It is possible to modify setpoint ( $d506$  in °C), the proportional band ( $d502$  in °C), and the maximum differential ( $d504$  in °C)

#### Dinamic setpoint in cooling mode

It is possible to modify setpoint ( $d505$  in °C), the proportional band ( $d501$  in °C), and the maximum differential ( $d503$  in °C)

### Plant pump on-off control

*Pre-pumping: when the unit is switched fromn STD-BY to COOL or HEAT mode firstly the pump is activated and, if there is no alarm, after the time of parameter  $Pi\ 20$  the first compèrressor can start-up.*

*Post-pumping: when the unit is switched from COOL or HEAt mode to STD-BY firstly the compressors are switched-off and after the time of parameter  $Pi\ 21$  the pump is switched off.*

If the pump is ON is always working at 100%.

### Plant pump modulating control

If the pump is driven by inverter (or similar modulating system) is possible to set the velocity between 30% and 100% of the maximum velocity modifying the parameters  $Pi\ 31$  in cooling,  $Pi\ 41$  in heating.

For instance with  $Pi\ 31=70$  and  $Pi\ 41=75$  the velocity will be 70% in cooling and 75% in heating

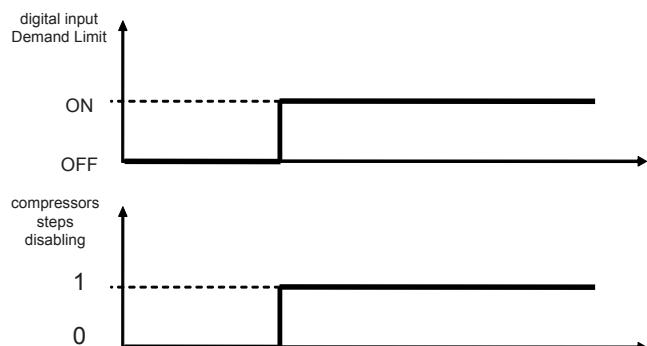

Note: When the compressors are off the pump works at minimum velocity.

Referring pre and post pumping the pump is managed as in on-off mode

### Demand limit

Basing on the state of a digital input, this function allows to force the unit to work with only 1 compressor, so reducing the power input demand.

To enable this function follow the indications of the section "Configurable Inputs".

## AVAILABLE FUNCTION

### Funzione economy

Basing on the state of a digital input, this function allows to modify the setpoint.

In cooling mode the setpoint is increased of the value of the parameter  $E_{r15}$  (es.  $E_{r15} + 5^{\circ}\text{C}$ ).

In heating mode the setpoint is decreased of the value of the parameter  $E_{r25}$  (es.  $E_{r25} - 6^{\circ}\text{C}$ )

To enable this function follow the indications of the section "Configurable Inputs"- "Economy".

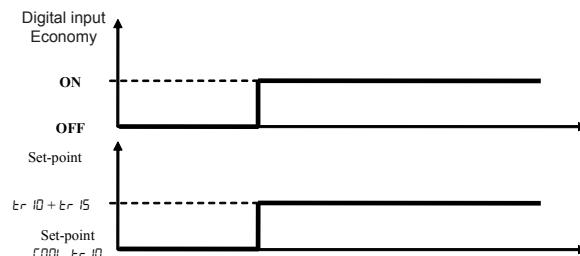

The activation of the Economy function is displayed by the switch-on of the led Economy on the display (money box symbol); it is possible to display the actual setpoint by the parameter  $SEt_{Er}$ .

The enabling of the Economy function has to be done considering the following scheme:

Cooling mode  $\text{COOL}$ :

$E_{r15}$  usually positive value

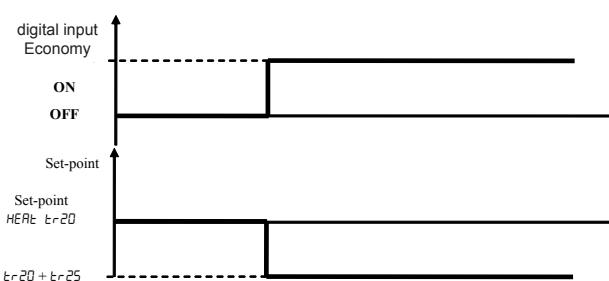

$E_{r10}$  set-point  $\text{COOL}$

Heating mode  $\text{HEAT}$ :

$E_{r25}$  usually negative value

$E_{r20}$  set-point  $\text{HEAT}$

### Recording hours of operation

The controller can record the hours of compressors and pumps operation. Access the "Status \ Hr" menu to show the values.

### Power failure

In case of a power failure, when the power is restored the controller will go to the status prior to the power failure. The procedure is cancelled if a defrost is in progress. All timing in progress is cancelled and reinitialised.

### Clock

The controller has an internal clock for memorising the date and time of each alarm occurring during unit operation (see "Alarms history"). The clock can be set by accordingly to "Date and time set up".

### History alarms

The controller is able to log and save up to 90 alarm events. Alarms are visible in the menu "Par \ EU".

Push SET to display alarm  $EU00$  (if present) that is always the latest,  $EU01$  is the one before and so on.

Scroll to UP and DOWN keys to display all the other alarms, push SET to display more information about the event chosen: alarm code (see alarm table), start event time, start event date, stop event time, stop event date, type of alarm (automatic or manual reset).

Example of an alarm visualization:

alarm event	$EU01$
L alarm code	$E_{r01}$
L start event time	20:01
L start event date	28.03

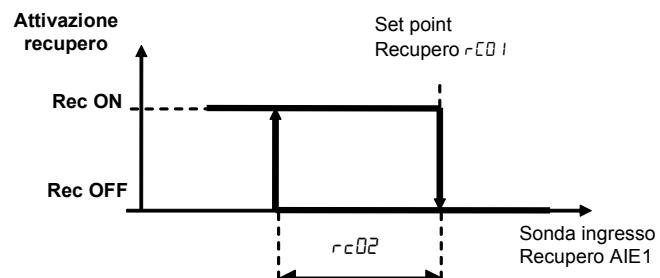

L stop event time	20:09
L stop event date	28.03
L type of alarm	AUTO / manu

### Total recovery function (VR unit only)

The recovery function thermoregulates on the inlet water AIE1 probe. If there is no demand for cooling power recovery can not be activated.

The parameters to adjust are:

$rC01$  recovery set point  
 $rC02$  recovery differential

## AVAILABLE FUNCTION

### Automatic change-over

This function is present in the heat pump unit.

The automatic change-over function is enable by  $SE01$  parameter - Enable change analogue input setting.

$SE01 = 0$       automatic change-over disable  
 $SE01 = 1$       automatic change-over enable

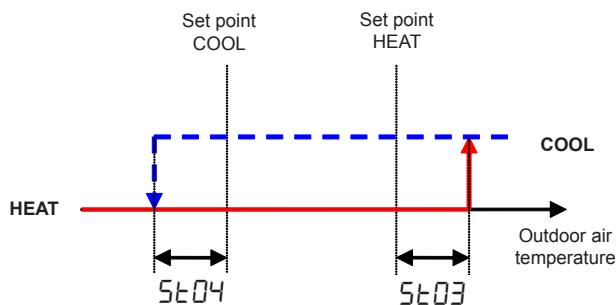

The automatic change-over can take place from the analog signal of the probe set by parameters  $SE02$  - probe selection for automatic change-over:

$SE02 = 0$       outdoor air temperature  
 $SE02 = 1$       inlet water temperature plant exchanger  
 $SE02 = 2$       outlet water temperature plant exchanger

The entrance in cooling and heating mode with two different differentials set by parameter  $SE03$  - Differential for automatic chan-over in heating - and  $SE04$  Differential for automatic chan-over in cooling

In the neutral zone (between the two set-point) mode can also be set by key.

Following an example of automatic change-over based on external air temperature ( $SE02 = 0$ )

Set point COOL and set point HEAT are the real set-point and can differ from set-point  $Er10$  and  $Er20$  due to climatic regulation enabled (economy function and dinamic set point)

Note:

-  $SE04$  is summed to set point COOL;  $SE03$  is summed to set point HEAT.

-  $(SE03 + SE04) < (\text{Set HEAT} - \text{Set COOL})$ , otherways the sum of the absolute value of the two differential may not overcome the value of (Set HEAT - Set COOL).

### Date and time set up

The electronic controller is equipped with internal clock (RTC) that allows to record in the alarm events date and hour of each alarm.

To modify date and hour, starting from the main view on the display, press the SET button.

A single pressure of the button SET enter the view of different folders.

Scroll the menu using UP and DOWN buttons until find the folder  $LL$ .

Press the SET button to enter in the menu.

Now in the display you have the label  $H\bar{O}Ur$ . You can choose to set hour, date and year scrolling the menu using UP and DOWN buttons.

Press the SET button for 3 seconds and enter in the modification menu.

To set hour, date and year it will be enough scroll UP and DOWN until the selected value, then press SET button.

To exit from the clock adjustment menu press the ESC button until arrive to main view on the display.

## AVAILABLE FUNCTION

### Timer scheduling

The scheduling allows to set weekly time zones to obtain a reduce in energy consumption when the cooling or heating demand is lower.

There are 3 time zones each one with 4 events per hour.

For each event, you can set hours and minutes of start and stop, an operating mode (Stand-by or ON), a cooling set point and a heating set point.

**ATTENTION: you can not change the operating mode via scheduling. The operating mode (cooling or heating) will be the same adopted before the enabling of time scheduling.**

To enable time scheduling you must set up the date and time into the controller

The parameters for the scheduling can be accessed in the “tE” (time event) folder.

#### Enabling

The function can be enabled with the parameters tE00 – Enabling scheduling

Parameters		descriptions	Value
tE00	Enabling scheduling	Scheduling disabled	0
		Scheduling enabled	1

#### Management time

For each day of the week you can select one of the 3 time zone available

Parameters	day	Time zone		
		1	2	3
tE01	Monday	1	2	3
tE02	Tuesday	1	2	3
tE03	Wednesday	1	2	3
tE04	Thursday	1	2	3
tE05	Friday	1	2	3
tE06	Saturday	1	2	3
tE07	Sunday	1	2	3

For each time zone you can associate 4 events.

The parameters involved in time events are described below:

#### Event hour start time

It determines the hour of the start of the event [0-23]

Event minute start time

**It determines the minutes of the start of the event [0-59]**

#### Operating Mode ON/Standy

It determines the operating mode during the event

- 0 = ON
- 1 = Stand-by

#### Set point Cool

It determines the set point in cooling mode that will be set if the unit is in cooling mode before time scheduling

#### Set point Heat

It determines the set point in heating mode that will be set if the unit is in heating mode before time scheduling

## AVAILABLE FUNCTION

### Summary parameters table for time scheduling

	Descrizione	Profilo 1	Profilo 2	Profilo 3
EVENT 1	Hour / minutes	EE 10..EE 14	EE38..EE42	EE66..EE70
	Mode operating ON/Standby	EE 10..EE 11	EE38..EE39	EE66..EE67
	SetPoint Cool	EE 13	EE41	EE69
	SetPoint Heat	EE 14	EE42	EE70
		EE 17..EE21	EE45..EE49	EE73..EE77
EVENT 2	Hour / minutes	EE 17..EE 18	EE45..EE46	EE73..EE74
	Mode operating ON/Standby	EE 19	EE47	EE75
	SetPoint Cool	EE20	EE48	EE76
	SetPoint Heat	EE21	EE49	EE77
		EE24..EE28	EE52..EE56	EE80..EE84
EVENT 3	Hour / minutes	EE24..EE25	EE52..EE53	EE80..EE81
	Mode operating ON/Standby	EE26	EE54	EE82
	SetPoint Cool	EE27	EE55	EE83
	SetPoint Heat	EE28	EE56	EE84
		EE31..EE35	EE59..EE63	EE87..EE91
EVENT 4	Hour / minutes	EE31..EE32	EE59..EE60	EE87..EE88
	Mode operating ON/Standby	EE33	EE61	EE89
	SetPoint Cool	EE34	EE62	EE90
	SetPoint Heat	EE35	EE63	EE91

### Example of timer scheduling:

You choose to set time zone 1 from Monday to Friday with the following setup:

At 07.30 you put the unit ON with a set point of 12°C in cooling mode, and 40°C in heating mode

At 12.30 you change the set point to 14°C in cooling mode, 37°C in heating mode

At 13.30 you change the set point to 12°C in cooling mode, 40°C in heating mode

At 18.00 you put the unit in stand-by

**You have to set the following parameters:**

EE00=1 enabling scheduling

EE01, EE02, EE03, EE04, EE05, = 1 time zone 1

#### EVENT 1 – unit ON

EE 10=8 hour

EE 11=30 minutes

EE 12= 0 ON, unit is ON (pay attention: 0=ON, 1=stand-by)

EE 13= 12 set point cool 12°C

EE 14=40 set point heat 40°C

#### EVENT 2 – change set point

EE17=12 hour

EE18=30 minutes

EE19= 0 ON, unit is ON (pay attention: 0=ON, 1=stand-by)

EE 20= 12 set point cool 14°C

EE 21=40 set point heat 37°C

#### EVENT 3 – change set point

EE 24=13 hour

EE 25=30 minutes

EE 26= 0 ON, unit is ON (pay attention: 0=ON, 1=stand-by)

EE 27= 12 set point cool 12°C

EE 28=40 set point heat 40°C

#### EVENT 4 – unit in stand-by

EE 31=18 hour

EE 32=00 minutes

EE 33= 1 stand-by, unit is in stand-by (pay attention: 0=ON, 1=stand-by)

EE 34= 12 set point cool 12°C

EE 35=40 set point heat 40°C

**The operating mode (cooling or heating) adopted is the one already active before the event happens.**

For Saturday or Sunday you can choose time zone 1 or another time zone (2 or 3) and set the parameters in a similar manner as described in this example.

## PARAMETERS

### Common parameters

Description	Unit	Min	Max	default value	Protection
TR10 - Temperature controller setpoint in COOL	°C	7	27	9	3
TR13 - Temperature control hysteresis	°C	0.1	25.5	1	2
TR14 - Steps/compressors insertion differential	°C	0.1	25.5	2.5	2
TR15 - Setpoint differential in Cool from economy input	°C	-25.5	25.5	5	1
TR20 - Temperature controller setpoint	°C	28	53	43	3
TR23 - Temperature control hysteresis	°C	0.1	25.5	1	2
TR24 - Steps/compressors insertion differential	°C	0.1	25.5	2.5	2
TR25 - Setpoint differential in Heat from economy input	°C	-25.5	25.5	-5	1
ds01 - Temperature controller dynamic differential proportional band in Cool	°C	-50	99.9	-10	1
ds02 - Temperature controller dynamic differential proportional band in Heat	°C	-50	99.9	10	1
ds03 - Maximum temperature controller dynamic differential in Cool	°C	-50	99.9	5	1
ds04 - Maximum temperature controller dynamic differential in Heat	°C	-50	99.9	-5	1
ds05 - Temperature controller dynamic differential setpoint in Cool	°C	-50	99.9	30	1
ds06 - Temperature controller dynamic differential setpoint in Heat	°C	-50	99.9	10	1
PI30 - Minimum Plant circuit water pump speed in Cool	%	0	100	20	2
PI31 - Maximum Plant circuit water pump speed in Cool	%	0	100	100	3
PI40 - Minimum Plant circuit water pump speed in Heat	%	0	100	30	2
PI41 - Maximum Plant circuit water pump speed in Heat	%	0	100	100	3
HI22 - Plant exchangerheaters maximum dynamic differential in integration	°C	0	99.9	10	1
HI25 - Plant exchangerheaters regulator hysteresis in integration	°C	0.1	25.5	2	2
HI26 - Plant exchangerheater 2 switch-on setpoint differential in integration	°C	0	99.9	3	2
AL15 - Flow switch activation/deactivation time on Plant circuit automatic alarm	sec	0	255	2	2
AL16 - Enable flow switch time for Plant circuit manual alarm	Sec x 10	0	255	2	2
AL51 - Plant circuit anti-freeze regulator setpoint alarm	°C	-50	99.9	3	1
AL52 - Plant circuit anti-freeze regulator hysteresis alarm	°C	0.1	25.5	2	2

### Specific parameters for VR unit

Description	Unit	Min	Max	default value	Protection
rC01 - Set point recovery	°C	-50	99.9	41	3
rC02 - Differential recovery	°C	0.1	25.5	2	1

Protection 3 = always accessible

Protection 1 = accessible by service

Protection 2 = not accessible

## CONFIGURABLE INPUTS

The configurable inputs are AI4, AI5 and DI5.

For configuration, access the parameters  $CL$  and select the required function according to the following tables.

I/O	ID	analogue / digital input	Configuration	Polarity	Offset (range) / Stato
AI4	S1	Not configured	$CL03 = 0$ $CL33 = 0$ $CL53 = 0$	----	----
		External probe sensor (provided with accessory SND3)	$CL03 = 2$ $CL33 = 9$ $CL53 = 0$	NTC probe	$CL23 (-12,0... +12,0 [^{\circ}C])$ $CL13 =$ Start value scale AI4 [^{\circ}C] $CL12 =$ Full scale value AI4 [^{\circ}C]
		External probe air as analog input 4-20 mA	$CL03 = 3$ $CL33 = 9$ $CL53 = 0$	----	$CL23 (-12,0... +12,0 [^{\circ}C])$ $CL13 =$ Start value scale AI4 [^{\circ}C] $CL12 =$ Full scale value AI4 [^{\circ}C]
		External probe air as analog input 0-10 V	$CL03 = 4$ $CL33 = 9$ $CL53 = 0$	----	$CL23 (-12,0... +12,0 [^{\circ}C])$ $CL13 =$ Start value scale AI4 [^{\circ}C] $CL12 =$ Full scale value AI4 [^{\circ}C]
		External probe air as analog input 0-5 V	$CL03 = 5$ $CL33 = 9$ $CL53 = 0$	----	$CL23 (-12,0... +12,0 [^{\circ}C])$ $CL13 =$ Start value scale AI4 [^{\circ}C] $CL12 =$ Full scale value AI4 [^{\circ}C]
		External probe air as analog input 0-1 V	$CL03 = 6$ $CL33 = 9$ $CL53 = 0$	----	$CL23 (-12,0... +12,0 [^{\circ}C])$ $CL13 =$ Start value scale AI4 [^{\circ}C] $CL12 =$ Full scale value AI4 [^{\circ}C]
		ATC	$CL03 = 1$ $CL33 = 0$ $CL53 = +21$	input active open contact	open contact = ATC active close contact = ATC not active
		ON/STBY remote (digital input)	$CL03 = 1$ $CL33 = 0$ $CL53 = +1$	input active open contact	open contact = STAND-BY close contact = ON
		Summer / Winter remote (digital input)	$CL03 = 1$ $CL33 = 0$ $CL53 = +3$	input active close contact	close contact = HEAT (Winter)
		Demand Limit 50% (digital input)	$CL03 = 1$ $CL33 = 0$ $CL53 = +21$	input active close contact	close contact = Demand Limit 50%
		Economy (digital input)	$CL03 = 1$ $CL33 = 0$ $CL53 = +22$	input active close contact	close contact = economy
AI5	S2	Not configured	$CL04 = 0$ $CL34 = 0$ $CL54 = 0$	----	----
		External probe sensor (analogic input)	$CL04 = 2$ $CL34 = 9$ $CL54 = 0$	NTC probe	$CL24 (-12,0... +12,0 [^{\circ}C])$
		ON/STBY remoto (digital input)	$CL04 = 1$ $CL34 = 0$ $CL54 = +1$	input active open contact	open contact = STAND-BY close contact = ON
		Summer / Winter remote (digital input)	$CL04 = 1$ $CL34 = 0$ $CL54 = +3$	input active open contact	close contact = HEAT (Winter)
		Demand Limit 50% (digital input)	$CL04 = 1$ $CL34 = 0$ $CL54 = +21$	input active open contact	close contact = Demand Limit 50%
		Economy (analogic input)	$CL04 = 1$ $CL34 = 0$ $CL54 = +22$	input active open contact	close contact = economy
DI5		Not configured	$CL44 = 0$	----	----
	QF2. 2	thermal pump 2	$CL44 = -48$	input active open contact	open contact = thermal pump 2
		ON/STBY remote	$CL44 = -1$	input active open contact	open contact = STAND-BY
		Summer / Winter remote	$CL44 = +3$	input active close contact	close contact = HEAT (Winter)
		Demand Limit 50%	$CL44 = +21$	input active close contact	close contact = Demand Limit 50%
		Economy	$CL44 = +22$	input active close contact	close contact = economy

\* If present the module of pumping two pumps can not get that DI5 must be configured  $CL44 = -48$

The outdoor air sensor (if installed) is factory installed on input AI4; if it is necessary you can install it on input AI4 or AI5, as specified above. The input AI4 can also accept an input signal current (4-20mA) or voltage (0-10V ,0-5V ,0-1V) from a probe external air by the user.

## PROBE CHARACTERISTICS

NTC10K-25°C type temperature probes are used.

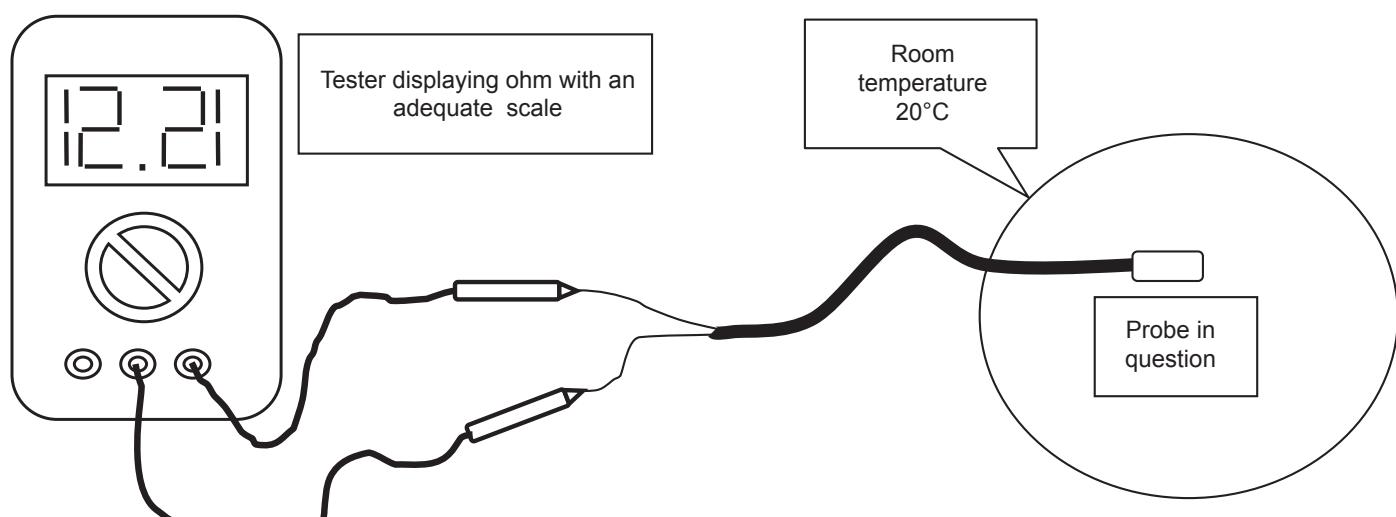

When the probe bulb is at a temperature of 25°C the electrical resistance measurable at the probe ends with a multimeter is approx. 10 kΩ. The thermistor of these probes has a negative temperature coefficient: the electrical resistance value decreases as the temperature increases.

To find out if a temperature probe is faulty or disconnected, check the correspondence between the resistance value in kΩ and the bulb temperature in °C according to the following table.

Temperature [°C]	Resistance [kΩ]	Temperature [°C]	Resistance [kΩ]	Temperature [°C]	Resistance [kΩ]
0	25,7950	20	12,2110	40	5,7805
1	24,8483	21	11,7628	41	5,5683
2	23,9363	22	11,3311	42	5,3640
3	23,0578	23	10,9152	43	5,1671
4	22,2115	24	10,5146	44	4,9774
5	21,3963	25	10,1287	45	4,7948
6	20,6110	26	9,7569	46	4,6188
7	19,8546	27	9,3988	47	4,4493
8	19,1259	28	9,0539	48	4,2860
9	18,4239	29	8,7216	49	4,1287
10	17,7477	30	8,4015	50	3,9771
11	17,0963	31	8,0931	51	3,8312
12	16,4689	32	7,7961	52	3,6906
13	15,8644	33	7,5100	53	3,5551
14	15,2822	34	7,2343	54	3,4246
15	14,7213	35	6,9688	55	3,2989
16	14,1810	36	6,7131	56	3,1779
17	13,6605	37	6,4667	57	3,0612
18	13,1592	38	6,2293	58	2,9489
19	12,6762	39	6,0007	59	2,8406

For a reliable check it is not necessary to control each single value, but just several sample values. If the instrument gives an infinite resistance, this means the probe is disconnected.

Example. With a temperature of 20°C on the probe, the ohmmeter display will indicate approx. 12.21 kΩ

## NETWORK COMUNICATION

The unit can communicate on serial line using the **Modbus** communication protocol with **RTU** coding.  
The unit can be connected to an RS485 network by means of the serial interface supplied as an accessory, and respond to requests from any master device connected to the network.

### Serial line settings

The serial line must be set as follows :

- baud rate : **9600**
- data bits : **8**
- stop bits : **1**
- parity : **even**

All the devices connected to the same serial line MUST use the same settings.

### Device address

To communicate correctly, each device connected to the serial network must have an univocal address ("Modbus individual address") of between 1 and 247. This address can be set by modifying the parameter CF63.

### Modbus commands

The Modbus commands implemented by the controller are :

- parameter reading **3** (Hex 03 : Read Holding Registers)
- parameter writing **16** (Hex 10 : Write Multiple Registers)

### Table of addresses

All the available resources are stored in the controller as WORD (2 byte) and therefore require the reading or writing of an entire Modbus register. According to the Modbus protocol, to identify a register of address X the address X-1 must appear in the message. Some registers contain more than one piece of information : in this case the bits representing the resource value are identified by means of the number of bits used ("Bit number") and by the least significant bit ("Lsb"). In the writing operation for these registers it is necessary to read the current register value, modify the bits representing the resource concerned and rewrite the entire register.

Example.

Bit number = 4  
Lsb = 7  
Resource value = 3

15	14	13	12	11	<b>10</b>	<b>9</b>	<b>8</b>	<b>7</b>	6	5	4	3	2	1	0
0	1	1	0	1	<b>0</b>	<b>0</b>	<b>1</b>	<b>1</b>	1	0	1	1	0	1	0

The resources can be read only (R), write only (W) or read and write (RW).

To interpret the value written in the register it is necessary to consider the value of CPL, EXP and UM :

CPL : if the register represents a number with sign (CPL = Y) carry out the following conversion :

0 = register value < 32767 : resource value = register value  
32768 = register value < 65535 : resource value = register value - 65536

EXP : indicates the exponent of the power of 10 to be multiplied by the register value to obtain the resource value.

EXP	Multiplier	
-2	$10^{-2}$	0,01
-1	$10^{-1}$	0,1
0	$10^0$	1
1	$10^1$	10
2	$10^2$	100

MU : indicates the unit of measure of the resource

**IMPORTANT.** DO NOT modify any parameter not indicated in the tables provided or indicated as a read only parameter (R), otherwise the warranty will be cancelled.

## NETWORK COMMUNICATION

### Modbus address table

Label	Description	RW	Register address		Bit number	Lsb	CPL	EXP	UM

<i>Er90</i>	Alarm history log full warning	R	33115,2	0815B	1 bit	2	N	0	flag

\* If several operation modes are enabled by mistake:

- STAND-BY has priority over HEATING, COOLING
- HEATING has priority over COOLING

## START-UP

### General Rules

To validate the contractual warranty, the unit must be set at work by technicians from an authorized assistance center. Before they are called, check to make sure that all parts of the installation have been completed, the unit levelled, the wet connections made with the relative air vent and the electrical connections made.

## MAINTENANCE

### General Rules

Maintenance is of extreme importance if the plant is to operate in a regular way and give fade-free service. Have extraordinary maintenance work done by qualified and authorized personnel, according to EU Regulation 303/2008 of 2 April 2008 (and later) that requires companies and technicians that perform maintenance / repair, leakage checking and recovery / recycling gases must be certified as required by local regulations. Comply with the safety precautions given in the relative section of this manual and take all the necessary precautions. The following information is only a guide for the end user.

Maintenance keeps unit efficiency, reduce the speed of deterioration over time and collect information and data to understand the efficiency of the unit and prevent failures. We suggest to prepare a booklet of installation according European legislation.

### Routine maintenance

The inspections described below, to which the unit must be subjected, do not require specific technical know-how.

They merely include a few simple inspections involving certain parts of the unit.

Call an authorized assistance center if actual maintenance work is required.

The table below gives a recommended list of inspections which should be carried out at the indicated intervals.

Provide controls and interventions more frequently in case of heavy (continuous or intermittent high, close to operating limits, etc ...) or critical (essential service such as data centres, hospital etc ...) use.

DESCRIPTION	WEEKLY	MONTHLY	EVERY SIX MONTHS
Visual inspection of the unit			•
Inspection of hydraulic circuit		•	
Inspection of electrical system		•	
Inspection of condensing system		•	
Inspection and adjustment of operat. parameters	•		

#### • Structure of the unit

When checking the condition of the parts that form the structure of the unit, pay particular attention to the parts liable to rust.

If traces of rust are noted, they must be treated with rust-inhibitor paint in order to eliminate or reduce the problem.

Check to make sure that the external panels and the fans of the unit are well fixed.

Bad fixing gives rise to noise and abnormal vibrations.

#### • Hydraulic circuit

Check visually to make sure that there are no leaks in the hydraulic circuit. If the pumping module accessory is installed, it is advisable to make sure that the water filter is clean.

#### • Electrical system

Make sure that the power cable that connects the unit to the distribution panel is not torn, cracked or damaged in a way that could impair its insulation.

## MAINTENANCE

### • Inspection of the condensing system

**WARNING:** The finned pack exchanger has fins made of aluminium or some other thin material, thus even accidental contact could cause cuts. Comply with the instructions in the relative section.

#### • Condensing coils

In view of the function of this component, it is very important for the surface of the exchanger to be as free as possible from clogging caused by items that could reduce the fan's air flow rate and, thus, the performances of the unit itself.

The following operations may be required:

- Remove all impurities (such as paper scraps, leaves, etc.) that could be clogging the surface of the bank either by hand or using a brush (comply with the above mentioned safety prescriptions).
- If the dirt has deposited on the fins and is difficult to remove by hand, use a flow of compressed air or pressurized water on the aluminium surface of the coils, remembering to direct the flow in a vertical and opposite to the standard flow direction to prevent the fins from being damaged.
- "Comb" the coils with the relative tool, using the appropriate comb spacing for the fins if some parts of them are bent or squashed.

#### • Helical electric fans

Visually inspect these parts to make sure that the electric fans are well fixed to the bearing grille and that this latter is fixed to the structure of the unit. Check the fan bearings, causing abnormal noise and vibration, and close the terminal box and cable glands.

#### • Water heat exchanger

The exchanger must ensure the maximum heat transfer possible so keep it clean and free from dirt that may reduce efficiency; make sure that the temperature difference between water outlet temperature and evaporation does not increase over time, if the difference exceeds 8 -10 ° C is necessary to proceed cleaning the water side of the exchanger, keeping in mind the following: water circulation must be in the opposite direction than normal, the fluid velocity does not exceed 1.5 times the nominal velocity and use just water or moderately acid products but only water for final washing.

#### • Water filter

Make sure to clean the filter and remove any impurities that block the proper flow of water, contributing to increase pressure drop and therefore energy consumption of the pumps.

#### • Water pumps (if present)

Check leakage, the state of the bearings (any anomalies are highlighted by noise and vibration), the closing of the terminal box and integrity of the cable.

#### • Reading and adjustment of the operating parameters

This control can be done using the pressure gauges (if installed) of the refrigerant circuits and using the pressure and temperature gauges (if installed) of the hydraulic circuits of the unit (evaporator + heat recovery - if present)

**Provide a unit book that allows you to track of the actions taken on the unit, so it will be easier to cadence adequately the various interventions and will facilitate a possible troubleshooting.**

**Please take note of: date, type of action, description of action, measurements performed, anomalies identified, alarms registered in the alarm history, etc. ...**

## MAINTENANCE

### General considerations

The unit has been designed with a view to reducing the risks to persons and the environment in which it is installed, to the minimum. To eliminate residue hazards, it is therefore advisable to become as familiar as possible with the unit in order to avoid accidents that could cause injuries to persons and/or damage to property.

#### a. Access to the unit

Only qualified persons who are familiar with this type of unit and who are equipped with the necessary safety protections (footwear, gloves, helmet, etc.) may be allowed to access the unit. Moreover, in order to operate, these persons must have been authorized by the owner of the unit and be recognized by the actual Manufacturer.

#### b. Elements of risk

The unit has been designed and built so as not to create any condition of risk. However, residue hazards are impossible to eliminate during the planning phase and are therefore listed in the following table along with the instructions about how to neutralize them.

Part in question	Residue hazard	Mode	Precautions
Compressor and delivery pipe	Burns	Contact with the pipes and/or compressor	Avoid contact by wearing protective gloves
Delivery pipes, heat recovery exchanger and coils	Explosion	Excessive pressure	Turn off the unit, check the high pressure switch and safety valve, the fans and condenser
Pipes in general	Ice burns	Leaking refrigerant	Do not pull on the pipes
Electrical cables, metal parts	Electrocution, serious burns	Defective cable insulation, live metal parts	Adequate electrical protection (correctly ground the unit)
Heat exchange coils	Cuts	Contact	Wear protective gloves
Fans	Cuts	Contact with the skin	Do not push the hands or objects through the fan grille

#### c. Pollution

The unit contains refrigerant gas and lubricating oil. When scrapping the unit these fluids must be recovered and disposed of in compliance with the regulations in force in the country where it is installed. **The unit must not be abandoned during the scrapping stage, but can be stored outside with gas, water and electrical connections closed.**

#### d. Disconnection and disposal

During disconnection of the unit, avoid gas leakage or liquid spillage on environment, especially if the water has additives or glycol. For dismissing and disposal, deliver the units to specialized centres according to your national laws.

# SAFETY AND POLLUTION

## Refrigerant safety card

### 1 SUPPLIER COMPANY AND PRODUCT IDENTIFICATION

Card No. FRIG 8  
Product R-410A  
Supplier company identification RIVOIRA SpA

### 2 COMPOSITION / INFORMATION ON INGREDIENTS

Substance / Preparation Preparation  
Components / Impurities Contains the following components :  
Difluoromethane (R32) 50 % in weight  
Pentafluoroethane (R125) 50 % in weight  
Non-applicable for mixtures / /

EEC No.  
Trade-name

### 3 IDENTIFICATION OF HAZARDS

Identification of hazards

Liquefied gas.  
The vapours are heavier than air and can cause suffocation, reducing the oxygen available for breathing.  
Rapid evaporation of the fluid can cause freezing.  
Can cause cardiac arrhythmia.

### 4 FIRST-AID MEASURES

Inhalation

Do not administer anything if the person has fainted.  
Take the person outdoors. Use oxygen or artificial respiration if necessary.

Contact with eyes  
Contact with skin  
Swallowing

Do not administer adrenaline or similar substances.  
Rinse thoroughly with plenty of water for at least 15 minutes and see a doctor.  
Wash immediately with plenty of water. Immediately remove all contaminated garments.

### 5 FIRE-PREVENTION MEASURES

Specific hazards  
Dangerous fumes  
Fire-extinguishing means usable  
Specific methods  
Special protection equipment

Increase in pressure.  
Halogen acids, traces of carbonyl halides.  
All the known fire-extinguishing means can be used.  
Cool the containers/tanks with water sprays.  
Use self-contained breathing apparatus in confined spaces.

### 6 MEASURES AGAINST ACCIDENTAL SPILLING OF THE PRODUCT

Personal protection

Evacuate personnel to safe areas. Provide for adequate ventilation. Use personal protection equipment  
It evaporates.  
It evaporates.

### 7 HANDLING AND STORAGE

Handling and storage

Ensure an adequate air change and/or extraction in the workplaces. Only use well-ventilated rooms.  
Do not breathe vapours or aerosols. Carefully close the containers and keep them in a cool, dry and well-ventilated place. Keep in the original containers.  
Explosives, flammable materials, organic peroxides.

### 8 CONTROL OF EXPOSURE / PERSONAL PROTECTION

Personal protection  
Control parameters

Ensure adequate ventilation, especially in closed areas.  
Difluoromethane (R32): Recommended exposure limits: AEL (8h and 12h TWA) = 1000 ml/m<sup>3</sup>  
Pentafluoroethane (R125): Recommended exposure limits: AEL (8h and 12h TWA) = 1000 ml/m<sup>3</sup>  
For rescue and for maintenance works in tanks, use self-contained breathing apparatus. The vapours are heavier than air and can cause suffocation, reducing the oxygen available for breathing.  
Total protection glasses.  
Rubber gloves.  
Do not smoke.

### 9 CHEMICAL-PHYSICAL PROPERTIES

Relative density, gas (air=1)  
Solubility in water (mg/l)  
Appearance  
Odour  
Fire point

Heavier than air.  
Not known, but deemed very low.  
Colourless liquefied gas.  
Similar to ether.  
Does not ignite.

### 10 STABILITY AND REACTIVITY

Stability and reactivity  
Materials to be avoided  
Hazardous products of decomposition

No decomposition if used according to the special instructions.

Alkali metals, alkali-earth metals, granulated metal salts, Al, Zn, Be, etc. in powder.  
Halogen acids, traces of carbonyl halides.

### 11 TOXICOLOGICAL INFORMATION

Local effects

Concentrations substantially above the value TLV (1000 ppm) can cause narcotic effects. Inhalation of highly concentrated products of decomposition can cause respiratory insufficiency (pulmonary oedema).  
No carcinogenic, teratogenic or mutagenic effects have been recorded in experiments on animals.  
Rapid evaporation of the fluid can cause freezing. Can cause cardiac arrhythmia.

### 12 ECOLOGICAL INFORMATION

Effects linked to ecotoxicity

Pentafluoroethane (R125)  
Potential global warming with halocarbides; HGWP (R-11 = 1) = 0.84  
Potential impoverishment of the ozone; ODP (R-11 = 1) = 0

### 13 CONSIDERATIONS ON DISPOSAL

General

Do not dispose of where accumulation can be hazardous.  
Usable with reconditioning.  
The depressurised containers must be returned to the supplier.  
Contact the supplier if instructions for use are deemed necessary.

## NOTE

The manufacturer declines all responsibility for any inaccuracies in this manual due to printing or typing errors.  
The manufacturer reserves the right to modify the products contents in this catalogue without previous notice.

## NOTE

## DECLARATION OF CONFORMITY
